Foreword

This DICOM Standard was developed according to the procedures of the DICOM Standards Committee.

The DICOM Standard is structured as a multi-part document using the guidelines established in [ISO/IEC Directives, Part 2].

PS3.1 should be used as the base reference for the current parts of this standard.

DICOM® is the registered trademark of the National Electrical Manufacturers Association for its standards publications relating to digital communications of medical information, all rights reserved.

HL7® and CDA® are the registered trademarks of Health Level Seven International, all rights reserved.

SNOMED®, SNOMED Clinical Terms®, SNOMED CT® are the registered trademarks of the International Health Terminology Standards Development Organisation (IHTSDO), all rights reserved.

LOINC® is the registered trademark of Regenstrief Institute, Inc, all rights reserved.
1 Scope and Field of Application

This part of the DICOM Standard specifies the DICOM Content Mapping Resource (DCMR), which defines the Templates and context groups used elsewhere in the standard.
2 Normative References

The following standards contain provisions that, through reference in this text, constitute provisions of this Standard. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this Standard are encouraged to investigate the possibilities of applying the most recent editions of the standards indicated below.

2.1 General

[ISO 3166] ISO. . Codes for the representation of names of countries.

2.2 BI-RADS® Terminology and Nomenclature

A portion of the terminology used within the Mammography CAD SR SOP Class and the Breast Imaging Report and Relevant Patient Information for Breast Imaging Templates is derived from BI-RADS®, a copyrighted lexicon of breast imaging terminology and nomenclature licensed by DICOM from the American College of Radiology.

2.3 MQCM 1999 Terminology and Nomenclature

References to MQCM 1999 are made in the description of the Mammography CAD SR SOP Class. In this MQCM 1999 refers to the Mammography Quality Control Manual 1999, available from the American College of Radiology. This document describes a standardized approach to mammographic acquisition standards, patient positioning, and so on. The DICOM standard does not require Mammography CAD SR SOP Class implementations to adhere to MQCM 1999.

2.4 MQSA Terminology and Nomenclature

References to MQSA are made in the description of the Mammography CAD SR SOP Class. In this MQSA refers to the Mammography Quality Standards Act final rules. While MQSA is a federal regulation of the United States government, it provides the only widely published standards for mammographic quality and is incorporated in this document for that reason. The DICOM standard does not require Mammography CAD SR SOP Class implementations to adhere to MQSA.

2.5 ACR Position Statement

2.6 Chest Radiology and CT

References are made in the description of the Chest CAD SR Templates and context groups.

[Fraser and Pare] Fraser, Muller, Colman, and Pare. 1999. 4th. I. xxxiii-xxxvi. Diagnosis of Diseases of the Chest. Terms for CT of the Lungs.

2.7 Response Evaluation Criteria

References to Response Evaluation Criteria are made from the Chest CAD SR Templates and context groups

2.8 Myocardial Segmentation

2.9 Quantitation of the Left Ventricle

- Standard -
2.10 Cancer Staging

2.11 Quantitative Arteriography and Ventriculography

2.12 IVUS

2.13 C-RADS CT Colonography Reporting and Data System

2.15 LOINC

This product includes all or a portion of the LOINC® table, LOINC panels and forms file, LOINC document ontology file, and/or LOINC hierarchies file, or is derived from one or more of the foregoing, subject to a license from Regenstrief Institute, Inc. Your use of the LOINC table, LOINC codes, LOINC panels and forms file, LOINC document ontology file, and LOINC hierarchies file also is subject to this license, a copy of which is available at http://loinc.org/terms-of-use. The current complete LOINC table, LOINC Users’ Guide, LOINC panels and forms file, LOINC document ontology file, and LOINC hierarchies file are available for download at http://loinc.org/. The LOINC table and LOINC codes are copyright © 1995-2014, Regenstrief Institute, Inc. and the Logical Observation Identifiers Names and Codes (LOINC) Committee. The LOINC panels and forms file, LOINC document ontology file, and LOINC hierarchies file are copyright © 1995-2014, Regenstrief Institute, Inc. All rights reserved.

The LOINC table (in all formats), LOINC panels and forms file, LOINC document ontology file, and LOINC hierarchies are provided "as is." Any express or implied warranties are disclaimed, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose.

A small portion of the LOINC table may include content (e.g., survey instruments) that is subject to copyrights owned by third parties. Such content has been mapped to LOINC terms under applicable copyright and terms of use. Notice of such third party copyright and license terms would need to be included if such content is included.

2.16 UCUM

This product includes all or a portion of the UCUM table, UCUM codes, and UCUM definitions or is derived from it, subject to a license from Regenstrief Institute, Inc. and The UCUM Organization. Your use of the UCUM table, UCUM codes, UCUM definitions also is subject to this license, a copy of which is available at http://unitsofmeasure.org/. The current complete UCUM table, UCUM Specification are available for download at http://unitsofmeasure.org/. The UCUM table and UCUM codes are copyright © 1995-2013, Regenstrief Institute, Inc. and the Unified Codes for Units of Measures (UCUM) Organization. All rights reserved.

The UCUM table (in all formats), UCUM definitions, and specification are provided "as is." Any express or implied warranties are disclaimed, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose.

2.17 Anesthesia Quality Institute Schema

Used by permission of the Anesthesia Quality Institute (AQI) (http://www.aqihq.org/), established by the American Society of Anesthesiologists (ASA).

2.18 Point-of-Care Medical Device Nomenclature

2.19 SNOMED Clinical Terms

This DICOM Standard incorporates SNOMED CT®, used by permission of the International Health Terminology Standards Development Organisation (IHTSDO). SNOMED CT®, was originally created by The College of American Pathologists (CAP). SNOMED CT® is a registered trademark of the International Health Terminology Standards Development Organisation, all rights reserved.

The SNOMED CT terms used in this Standard (the SNOMED CT DICOM Subset) are the subject of a licensing agreement between NEMA and IHTSDO that allows the use of this defined subset in DICOM conformant applications without further license or payment of fee. Any use of SNOMED CT beyond the terms published in the DICOM Standard is subject to SNOMED CT licensing rules, which may include a fee. For further information about SNOMED CT licensing, go to http://www.ihtsdo.org/snomed-ct/get-snomed-ct or contact IHTSDO at mailto:info@ihtsdo.org.

This DICOM Standard incorporates various veterinary terms from the SNOMED CT VetSCT extension, used by permission of the Veterinary Terminology Services Laboratory (VTSL) (http://vtsl.vetmed.vt.edu/). These terms were previously included in SNOMED CT but have since been inactivated as moved elsewhere.

2.20 Prostate Reporting Terminology and Nomenclature

The Prostate Imaging and Report and Data System Version 2 (PI-RADS v2) is a joint effort of the European Society of Urogenital Radiology, the American College of Radiology and the AdMetech Foundation.

Note

PI-RADS is also available from the following sources:

3 Definitions

For the purposes of this Standard the following definitions apply.

3.1 Codes and Controlled Terminology Definitions:

The following definitions are commonly used in this Part of the DICOM Standard:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baseline Context Group Identifier (BCID)</td>
<td>Identifier that specifies the suggested Context Group for a Code Sequence Attribute. See Table 5.6-1 “Conventions for Specification of Context Groups” in PS3.3.</td>
</tr>
<tr>
<td>Baseline Template Identifier (BTID)</td>
<td>Identifier that specifies a Template suggested to be used in the creation of a set of Content Items.</td>
</tr>
<tr>
<td>Coding Scheme</td>
<td>Dictionary (lexicons) of concepts (terms) with assigned codes and well defined meanings. Note: Examples of coding schemes include SNOMED and LOINC.</td>
</tr>
<tr>
<td>Context Group</td>
<td>A set of coded concepts defined by a Mapping Resource forming a set appropriate to use in a particular context.</td>
</tr>
<tr>
<td>Context ID (CID)</td>
<td>Identifier of a Context Group.</td>
</tr>
<tr>
<td>Defined Context Group Identifier (DCID)</td>
<td>Identifier that specifies the Context Group for a Code Sequence Attribute that shall be used. See Table 5.6-1 “Conventions for Specification of Context Groups” in PS3.3.</td>
</tr>
<tr>
<td>Defined Template Identifier (DTID)</td>
<td>Identifier that specifies a Template that shall be used in the creation of a set of Content Items.</td>
</tr>
<tr>
<td>Extensible Context Group</td>
<td>Context Group that may be extended by a particular application by inclusion of additional concepts. See Table 5.6-1 “Conventions for Specification of Context Groups” in PS3.3.</td>
</tr>
<tr>
<td>Extensible Template</td>
<td>A Template that may be extended by a particular application by inclusion of additional Content Items beyond those specified in the Template.</td>
</tr>
<tr>
<td>Mapping Resource</td>
<td>A resource that defines context-dependent usage constraints (i.e., Value Set or Relationship Type restrictions) for Attributes. A resource that specifies the mapping of the content of an external controlled terminology to the components of a message standard.</td>
</tr>
<tr>
<td>Non-Extensible Context Group</td>
<td>Context Group whose defined set of concepts shall not be extended by an application. See Table 5.6-1 “Conventions for Specification of Context Groups” in PS3.3.</td>
</tr>
<tr>
<td>Non-Extensible Template</td>
<td>A Template that specifies the exact set of Content Items and corresponding Value Sets that shall be used and that shall not be extended by an application.</td>
</tr>
<tr>
<td>Relationship Type</td>
<td>The association between two Concepts. Examples: &quot;HAS PROPERTIES&quot;, &quot;CONTAINS&quot;, &quot;INFERRED FROM&quot;.</td>
</tr>
<tr>
<td>Root Template</td>
<td>A Template whose first content item is a CONTAINER content item intended to be encoded in the top level Data Set of a SOP Instance. I.e., the &quot;root node&quot; of the &quot;content tree&quot;.</td>
</tr>
</tbody>
</table>
Template

A pattern that describes the Content Items, Value Types, Relationship Types and Value Sets that may be used in part of a Structured Report content tree, or in other Content Item constructs, such as Acquisition Context or Protocol Context. Analogous to a Module of an Information Object Definition.

Template ID (TID)

Identifier of a Template.

Value Set

The allowed values of a Code Sequence Attribute in a given context. Specified either as one or more individual values or by reference to a Context Group.

3.2 Information Object Definitions:

This Part of the Standard makes use of the following terms defined in PS3.3:

Code Sequence Attribute

See PS3.3.
4 Symbols and Abbreviations

The following symbols and abbreviations are used in this Part of the Standard.

Mammography  Computer-Aided Detection and/or Computer-Aided Diagnosis for Mammography
CAD
Chest CAD  Computer-Aided Detection and/or Computer-Aided Diagnosis for chest radiography
Colon CAD  Computer-Aided Detection and/or Computer-Aided Diagnosis for colon radiography
ACR  American College of Radiology
ASE  American Society of Echocardiography
CAP  College of American Pathologists
DCMR  DICOM Content Mapping Resource
FHIR  Fast Healthcare Interoperability Resources
HTML  HyperText Markup Language
IHE  Integrating the Healthcare Enterprise
IHE SVS  IHE Sharing Value Sets
JSON  JavaScript Object Notation
NEMA  National Electrical Manufacturers Association
RECIST  Response Evaluation Criteria In Solid Tumors
SNOMED  Systematized Nomenclature of Medicine
UCUM  Unified Code for Units of Measure
WHO  World Health Organization
XML  eXtensible Markup Language
EV  Enumerated Value
DT  Defined Term
CNAME  Context Group Name
TNAME  Template Name
BCID  Baseline Context Group ID
DCID  Defined Context Group ID
ECID  Enumerated Context Group ID
BTID  Baseline Template ID
DTID  Defined Template ID
ETID  Enumerated Template ID

The following upper-case abbreviations represent specific Attributes:

CV  Code Value (0008,0100) or Long Code Value (0008,0119) or URN Code Value (0008,0120)
CSD  Coding Scheme Designator (0008,0102)
CM  Code Meaning (0008,0104)
CSV  Coding Scheme Version (0008,0103)
5 Conventions

Terms listed in Section 3 are capitalized throughout the document.
6 Form of Template Specifications

Templates are patterns that specify the Concept Names, Requirements, Conditions, Value Types, Value Multiplicity, Value Set restrictions, Relationship Types and other attributes of Content Items for a particular application.

An IOD may specify that particular Standard Templates shall be used or may be used to define or constrain the content of a Content Item construct. A Content Item construct includes a coded concept name and one of several types of coded values. Content Item constructs are used in:

- the main Data Set and recursively nested Content Sequences (0040,A730) of the SR Document Content Module
- the Acquisition Context Sequence (0040,0555) of the Acquisition Context Module,
- the Protocol Context Sequence (0040,0440) and Content Item Modifier Sequence (0040,0441) of the Scheduled Procedure Step Module, Image Acquisition Results Module, and others.
- the Specimen Preparation Step Content Item Sequence (0040,0612) of the Specimen Module.

Annexes A and C of this Part define Standard Templates.

Note

Standard Extended and Private Templates may be defined by implementers of the Standard. The rules for definition of Standard Extended and Private SR Templates are similar to the rules for definition of Standard Extended and Private SOP Classes. One row of a Template definition table corresponds to one row of a Module table.

Each Standard Template is specified by a Template table in this Part. Each Template table specifies exactly one Template, corresponding to a pattern of content within a Content Item construct.

Each Template table identifies whether the order of Content Items is significant or not significant. SOP Instances whose content is based on a Template where the order is significant shall encode the top level Content Items in the order they are specified in the Template, and the subsidiary Content Items under each parent item in the order they are specified, and so on for each Nesting Level. The significance of the order applies only to the Template itself; subsidiary included Templates may have a different order significance.

Note

Even if a Template specifies that the order is not significant, there may be significance to the order in which Content Items are encoded in a SOP Instance. For example, CONTAINER Content Items with attribute Continuity of Content (0040,A050) value CONTINUOUS encode Content Items in narrative sequence, and procedure logs encode Content Items in time order.

The Content Items from subsidiary Templates may be intermingled if and only if the parent and subsidiary all specify that the order is not significant. This permits later refactoring into reusable Templates.

The range of concepts and the options that are permitted in a family of SR Documents vary inversely with the level of constraint that is applied by the corresponding SR Template. The more narrow the range of concepts and the more restricted the options permitted by a Template, the more predictable the content of the SR Documents will be.

Note

1. A very specific Template defines a family of SR Documents that are very similar to each other. They have a narrow range of content options (e.g., high level of constraint of Content Item values; use of CODE or NUM with Enumerated Context Groups) and their content is therefore highly predictable. A very general (e.g., permissive or broad) Template defines a family of SR Documents that may differ considerably from one another. They have a broader range of content options (e.g., low level of constraint of Content Item values; use of TEXT and relatively little restriction of Content Item values) and their content is less predictable.

2. The degree of interoperability that may be achieved with a family of SR Documents generated from a Template may be determined intentionally and precisely at a desired level by appropriate Template design to achieve the necessary degree of predictability of SR Document contents.
6.1 Template Table Field Definition

SR Templates are described using tables of the following form:

<table>
<thead>
<tr>
<th>Type:</th>
<th>(Non-) Extensible</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order:</td>
<td>(Non-) Significant</td>
</tr>
<tr>
<td>Root:</td>
<td>Yes or No</td>
</tr>
</tbody>
</table>

Table TID <#>. <SR Context Template Name>

<table>
<thead>
<tr>
<th>NL</th>
<th>Rel with Parent</th>
<th>VT</th>
<th>Concept Name</th>
<th>VM</th>
<th>Req Type</th>
<th>Condition</th>
<th>Value Set Constraint</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Acquisition Context Templates are described using tables of the following form:

<table>
<thead>
<tr>
<th>Type:</th>
<th>(Non-) Extensible</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order:</td>
<td>(Non-) Significant</td>
</tr>
</tbody>
</table>

Table TID <#>. <Acquisition Context Template Name>

<table>
<thead>
<tr>
<th>VT</th>
<th>Concept Name</th>
<th>VM</th>
<th>Req Type</th>
<th>Condition</th>
<th>Value Set Constraint</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Protocol Context Templates are described using tables of the following form:

<table>
<thead>
<tr>
<th>Type:</th>
<th>(Non-) Extensible</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order:</td>
<td>(Non-) Significant</td>
</tr>
</tbody>
</table>

Table TID <#>. <Protocol Context Template Name>

<table>
<thead>
<tr>
<th>NL</th>
<th>VT</th>
<th>Concept Name</th>
<th>VM</th>
<th>Req Type</th>
<th>Condition</th>
<th>Value Set Constraint</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The semantics of the fields (columns) of Template tables are defined by subsections of this Section. A row of a Template table specifies either one Content Item or inclusion of another Template that may specify any number of Content Items (see Section 6.2.3 for definition of Included Templates). Each Template table is named by a title, identified by a TID number and further explained by a description such as explanation of Template contents, purpose and use cases.

The following conventions are defined for the form of references to coded concepts, Context Groups and Templates.

Code Meanings are enclosed in quotation marks (for example "cm"). Code Values and Coding Scheme Designators are not enclosed in quotation marks unless a comma occurs in the string.

References to coded concepts take the following form:

- EV or DT (CV, CSD, "CM")
  - e.g., an Enumerated Value with only CV, CSD, and CM defined is represented as follows: EV (CV, CSD, "CM"), for example EV (T-04000, SRT, "Breast").
- MemberOf { BCID or DCID (CID) CNAME } MemberOf selects one term from the specified context group.
If reference to a specific coding scheme version is required, it takes the following form:

- EV or DT (CV, CSD [CSV], "CM")
  
e.g., DT (D3-81922, SRT [V1], "Aortic fistula").

References to Context Groups take the following form:

- BCID or DCID (CID) CNAME
  
e.g., Defined Context Group 5000 is represented as follows: DCID (5000) Language.

References to Templates take the following form:

- BTID or DTID (TID) TNAME
  
e.g., Baseline Template 1000 is represented as follows: BTID (1000) Quotation.

### 6.1.1 Row Number

Each row of a Template Table is denoted by a row number. The first row is numbered 1 and subsequent rows are numbered in ascending order with increments of 1. This number denotes a row for convenient description as well as reference in conditions. The Row Number of a Content Item in a Template may or may not be the same as the ordinal position of the corresponding Sequence Item (representing the Content Item) in a Content Sequence (0040,A730), depending on the number of times the Content Item is repeated.

The Content Item specified in the first row of a Template Table may be of any Value Type. Specifically, it is not constrained to be a CONTAINER.

### 6.1.2 Nesting Level (NL)

The nesting level of Content Items is denoted by "\" symbols, one per level of nesting below the initial Source Content Item (of the Template) in a manner similar to the depiction of nested Sequences of Items in Modules Tables in PS3.3. When it is necessary to specify the Target Content Item(s) of a relationship, they are specified in the row(s) immediately following the corresponding Source Content Item. The Nesting Level of a Target Content Item is one greater than the Nesting Level of the corresponding (parent) Source Content Item. The Content Item specified in row 1 of a Template Table is at the top level (i.e., no "\" symbol is ever present in the NL field for the first Content Item in the table).

Acquisition Context Templates have no Nesting Level field. Protocol Context and UPS Processing Parameter Templates allow a single Nesting Level implemented through the Content Item Modifier Sequence (see PS3.3).

### 6.1.3 Relationship With Source Content Item (Parent)

Relationship Type and Relationship Mode (i.e., By-value or By-reference) constraints, if defined, are specified in this field, as described Table 6.1.3-1.

Relationship Type and Mode are specified for each row that specifies a target Content Item.

Relationship Type and Mode may also be specified when another Template is included, either "top-down" or "bottom-up" or both (i.e., in the "INCLUDE Template" row of the calling Template, or in all rows of the included Template, or in both places). There shall be no conflict between the Relationship Type and Mode of a row that includes another Template and the Relationship Type and Mode of the rows of the included Template.

**Note**

SR IODs specify Enumerated Values for Relationship Types. If a Relationship Type other than one of the Defined Terms for Relationship Type (0040,A010) is specified in a Private SOP Class, there is a significant risk to interoperability. Documentation accompanying Templates for Private SOP Classes should define any Relationship-type extensions in the manner that the Standard Relationship Types are defined in PS3.3.

Acquisition Context and Protocol Context Templates have no Relationship field.
Table 6.1.3-1. Syntax of Relationship Constraints

<table>
<thead>
<tr>
<th>Expression</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>RTYPE</td>
<td>Relationship Mode is By-value and Relationship Type is RTYPE. For example, &quot;INFERRED FROM&quot;.</td>
</tr>
<tr>
<td>R-RTYPE</td>
<td>Relationship Mode is By-reference and Relationship Type is RTYPE. For example, &quot;R-INFERRED FROM&quot;.</td>
</tr>
</tbody>
</table>

6.1.4 Value Type (VT)

The Value Type field specifies the SR Value Type of the Content Item or conveys the word "INCLUDE" to indicate that another Template is to be included (substituted for the row). See Section 6.2.3 for further description of "Included Templates".

6.1.5 Concept Name

Any constraints on Concept Name are specified in this field as defined or enumerated coded entries, or as baseline or defined context groups. Alternatively, when the VT field is "INCLUDE", the Concept Name field specifies the Template to be included.

6.1.6 Value Multiplicity (VM)

The VM field indicates the number of times that either a Content Item of the specified pattern or an included Template may appear in this position. Table 6.1.6-1 specifies the values that are permitted in this field.

Table 6.1.6-1. Permitted Values for VM

<table>
<thead>
<tr>
<th>Expression</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>i (where 'i' represents an integer)</td>
<td>Exactly i occurrences, where i&gt;=1. E.g., when i=1 there shall be one occurrence of the Content Item in this position.</td>
</tr>
<tr>
<td>i-j (where 'i' and 'j' represent integers)</td>
<td>From i to j occurrences, where i and j are &gt;=1 and j&gt;i.</td>
</tr>
<tr>
<td>i-n (where 'i' and 'n' represent integers)</td>
<td>i or more occurrences, where i&gt;=1.</td>
</tr>
</tbody>
</table>

6.1.7 Requirement Type

The Requirement Type field specifies the requirements on the presence or absence of the Content Item or included Template.

Note

There is typically no need to specify Requirement Type separately for SCU and SCP of the Basic SR SOP Classes, because the SCP is required to support the entire content of any SR Document it receives. Therefore, for Basic SR SOP Classes, Requirement Type effectively only applies to the SCU.

The following symbols are used:

- **M** Mandatory. Shall be present.
- **MC** Mandatory Conditional. Shall be present if the specified condition is satisfied.
- **U** User Option. May or may not be present.
- **UC** User Option Conditional. May not be present. May be present according to the specified condition.

Note

There is an interaction between the VM and the Requirement Type with respect to the number of times that a Content Item (or included Template) may actually be present, as follows:

<table>
<thead>
<tr>
<th>Req Type</th>
<th>VM</th>
<th>Actual number of occurrences in the content tree</th>
</tr>
</thead>
<tbody>
<tr>
<td>M</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>M</td>
<td>1-n</td>
<td>1 to n</td>
</tr>
<tr>
<td>U</td>
<td>1</td>
<td>0 or 1</td>
</tr>
</tbody>
</table>
6.1.8 Condition

The Condition field specifies any conditions upon which presence or absence of the Content Item or its values depends. This field specifies any Concept Name(s) or Values upon which there are dependencies.

References in Condition statements to coded concepts or values, whether to select a Content Item to test or to specify a value to test against, are of the form (CV, CSD, "CM"). As is always the case for coded entries, the matching is performed against CV and CSD, irrespective of the string value of CM.

References may also be made to row numbers (e.g., to specify exclusive OR conditions that span multiple rows of a Template table).

The following abbreviations are used:

**XOR**  Exclusive OR. One and only one row shall be selected from mutually-exclusive options.

Note

For example, if one of rows 1, 2, 3 or 4 may be included, then for row 2, the abbreviation "XOR rows 1, 3, 4" is specified for the condition.

**IF**  Shall be present if the condition is TRUE; may be present otherwise.

**IFF**  If and only if. Shall be present if the condition is TRUE; shall not be present otherwise.

6.1.9 Value Set Constraint

Value Set Constraints, if any, are specified in this field as defined or enumerated coded entries, or as baseline or defined context groups.

The Value Set Constraint column may specify a default value for the Content Item if the Content Item is not present, either as a fixed value, or by reference to another Content Item, or by reference to an Attribute from the data set other than within the Content Sequence (0040,A730).

6.1.9.1 NUM Units Constraint

Constraints on units of measurement, if any, are specified in the Value Set Constraint field if and only if the Value Type is NUM. The constraints are specified either as defined or enumerated coded entries, or as baseline or defined context groups.

6.1.9.2 CONTAINER Continuation Flag Constraint

The value of the Continuity of Content Flag (0040,A050) may be specified in the Value Set Constraint field if and only if the Value Type is CONTAINER.

Note

The SR Document Content Module specifies "SEPARATE" and "CONTINUOUS" as the Enumerated Values for Continuity of Content Flag (0040,A050).

6.1.9.3 SCOORD Graphic Type Constraint

Constraints on the value of the Graphic Type (0070,0023) may be specified in the Value Set Constraint field if and only if the Value Type is SCOORD. The constraint may specify a set of allowed values, or a set of disallowed values. For example:

- GRAPHIC TYPE = [POINT]
- GRAPHIC TYPE = [CIRCLE, ELLIPSE]
- GRAPHIC TYPE = not {MULTIPOINT}
6.2 Special Conventions for Template Tables

6.2.1 Multiple Value Sets Depending On Different Conditions

When a Content Item may have different value sets, each depending on different conditions, the description of each different case begins in a separate row of the Template Table.

6.2.2 Target Content Items of Relationships

When it is necessary to specify the Target Content Item(s) of a relationship, they are specified in the row(s) immediately following the Source Content Item. The Nesting level of a Target Content Item (or set of Target Content Items specified indirectly via an ‘include Template’ macro) is one greater than the Nesting Level of the corresponding Source Content Item, as indicated by an increase in the number of “>” characters in the nesting level.

When a Content Item may be the Source of multiple relationships having different Relationship Types and/or different Relationship Modes and/or different patterns of Target Content Item(s), the description of each different case begins in a separate row of the Template Table.

When the Source Content Item of a relationship has VM of greater than 1, the specified pattern of Target Content Items applies to all instantiations of the Source Content Item.

Note

For example, if a Template specifies that the VM of a Source Content Item is 1-n and specifies a By-value relationship to two CODE Content Items with particular value set constraints, then each instantiation of the Source Content Item has a By-value relationship to two CODE Content Items with the specified value constraints.

When a Source Content Item that has a Requirement Type of U, UC or MC is not present (is not instantiated), no Target Content Items of that Source Content Item are present, even if one or more of the Target Content Items is designated with a Requirement Type of M or MC.

Note

In other words, potential children are not present when there is no parent.

6.2.3 Inclusion of Templates

A Template may specify another Template to be included by specifying "INCLUDE" in the Value Type field and the identifier of the included Template in the Concept Name field. All of the rows of the specified Template are in included in the invoking Template, effectively substituting the specified Template for the row where the inclusion is invoked. Whether or not the inclusion is user optional, mandatory or conditional is specified in the Requirement and Condition fields. The number of times the included Template may be repeated is specified in the VM field.

6.2.3.1 Template Parameters

A Template that is included by another Template may include parameters that are replaced by values defined in the invoking Template. Parameters may be used to specify coded concepts or Context Groups in the Concept Name, Condition, or Value Set Constraint fields of a Template.

An included Template that accepts parameters shall be introduced by a table listing those parameters of the form:

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Parameter Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Parameters are indicated by a name beginning with the character "$".
The invoking Template may specify the value of the parameters in the included Template by name in the Value Set Constraint field of the INCLUDE row. The parameter in the included Template shall be replaced by the specified parameter value. Specification of a parameter value shall be of one of the following forms:

<table>
<thead>
<tr>
<th>Notation</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\text{parametername} = \text{EV or DT (CV, CSD, &quot;CM&quot;)}$</td>
<td>The parameter passed to the Template is the specified coded term.</td>
</tr>
<tr>
<td>$\text{parametername} = (\text{CV, CSD, &quot;CM&quot;)}$</td>
<td>The parameter passed to the Template is the specified coded term, used</td>
</tr>
<tr>
<td></td>
<td>as a parameter in a Condition field of the included Template.</td>
</tr>
<tr>
<td>$\text{parametername} = \text{BCID or DCID (CID) CNAME}$</td>
<td>The parameter passed to the Template is the Context Group.</td>
</tr>
<tr>
<td>$\text{parametername} = \text{MemberOf (BCID or DCID (CID) CNAME)}$</td>
<td>The parameter passed to the Template is a single coded term from the</td>
</tr>
<tr>
<td></td>
<td>Context Group in curly braces.</td>
</tr>
</tbody>
</table>

The specification of a parameter value is valid only for the directly included Template. Therefore, it needs to be explicitly respecified in Templates intermediate between the originally specifying Template and the target Template. The intermediate Template may use the same parameter name as used by the Template it invokes; in such a case, the intermediate Template would invoke the subsidiary Template with a specification in the Value Set Constraint field such as:

$\text{parametername} = \text{parametername}$

Note

In this case, the left hand instance of $\text{parametername}$ is the name in the subsidiary Template, and the right hand instance is the (parametrized) value passed into the current Template.

The invoking Template is not required to specify all parameters of included Templates. If not specified, the value set (term or context group) for that parameter is unconstrained. An unconstrained value in a Condition will cause the condition to fail.

### 6.2.4 Post-coordinated Codes and Has Concept Modifier Relationship

Though it may not be explicitly shown in a particular Template, the use of any coded Concept Name in any Content Item may be defined in a post-coordinated rather than pre-coordinated manner, unless explicitly forbidden by the IOD or the Template.

Accordingly, any such Content Item may have any number of Target Content Items via a “HAS CONCEPT MOD” relationship, even if not explicitly specified in a Template. Each Target Content Item of such a relationship may be more complicated than a single Content Item if the IOD permits (i.e., the post-coordinated concept may potentially be defined by a complex sub-tree).

### 6.2.5 Extension of Templates

An Extensible Template may be extended in an Application generating SOP Instances to include additional Content Items in its definition. Such Content Items shall not duplicate concepts for which an encoding is defined in the Template. I.e., if a method is provided for the encoding of a concept in the Template, that concept shall not be encoded using a different Content Item in an extension to the Template.

Note

There is no requirement that the included additional Content Items in a Template extension be placed at the end of the Template. The additional Content Items may be included at any semantically appropriate location in the Template, regardless of whether the order of Content Items in the Template is significant.

A Non-extensible Template shall not be modified in an Application by the addition of Content Items to its definition.

Note

The set of Content Items in either an Extensible or a Non-extensible Template may be changed in subsequent editions of the Standard, in accordance with the procedures of the DICOM Standards Committee.

A Non-Extensible Template may include a Template that is Extensible. In invoking such a Template, the content structure of SOP Instances created from the Non-Extensible Template may vary according to the varying content structure allowed by the extension of the included Template.
Note

Specification of such extensible content in a Non-Extensible Template may be desirable if the Template defines, e.g., a fixed top level structure into which a variety of lower level structures may be "plugged".
7 DCMR Context Group Specifications

Context Groups specify Value Set restrictions for Code Value (0008,0100) (or Long Code Value (0008,0119) or URN Code Value (0008,0120)) and Code Meaning (0008,0104) of Code Sequence Attributes for given functional or operational contexts. This Section specifies the semantics of DCMR Context Group Tables.

7.1 Context Group Table Field Definition

Context Groups are described using tables of the following form (optional columns are shown with italic column titles):

<table>
<thead>
<tr>
<th>Resources:</th>
<th>HTML</th>
<th>FHIR JSON</th>
<th>FHIR XML</th>
<th>IHE SVS XML</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>(Non-) Extensible</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Version:</td>
<td>&lt;yyyymmdd&gt;</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>UID:</td>
<td>1.2.840.10008.6.1.uuuu</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

A row of a Context Group table specifies one coded concept. Each Context Group table is named by a title and identified by a CID number and version.

The columns of the tables consist of:

- Coding Scheme Designator: the value of Coding Scheme Designator (0008,0102)
- Code Value: the value of Code Value (0008,0100) or Long Code Value (0008,0119) or URN Code Value (0008,0120)
- Coding Meaning: the value of Code Meaning (0008,0104)

In those cases where it is necessary, Coding Scheme Version (the value of Coding Scheme Version (0008,0103)) may also be specified. This column may be absent if Coding Scheme Version is not required for any of the coded concepts in the Context Group.

The value specified in the Code Meaning field is an acceptable value for the specified code value, but does not preclude the use of other synonymous text in the same or other language.

Note

1. Some coding schemes do not specify the equivalent of a Code Meaning.
2. Capitalization in the Code Meaning is generally not significant, except for abbreviations used in units of measurement prefixes (e.g., "ml" milliliter vs. "Ml" megaliter, or "pV" picovolt vs. "PV" petavolt).

If further description of the concept represented by the code is required in the DCMR (rather than referring to an external coding scheme), it is included in a separate table.

Optional columns may provide an informative mapping from the coded concepts of the Context Group to a reference terminology specified in the column heading. Typical reference terminologies include SNOMED CT and UMLS.

An optional column may provide a normative baseline or defined set of units to use for numeric measurements using the concept, either as a single term (e.g., DT ([ratio], UCUM, "ratio")), a list of such terms, or a reference to a Context Group (e.g., DCID 7277 "Units of Diffusion Rate Area Over Time").

A Context Group may alternatively be defined by narrative reference to an externally defined coding scheme.
Note

See for instance CID 82 “Units of Measurement”.

7.2 Special Conventions for Context Group Tables

7.2.1 Include Context Group

The ‘Include Context Group’ macro is a concise mechanism for including (by-reference) all of the rows of a specified Context Group in the invoking Context Group, effectively substituting the specified Context Group for the row where the macro is invoked. If an ‘Include Context Group’ is specified, it shall be specified in the Concept Name column of a Context Group Table. Table 7.2.1-1 specifies the syntax of the ‘Include Context Group macro. Inclusion may be nested, in that included Context Groups may themselves include other Context Groups. This gives rise to the possibility of circular inclusion and multiple inclusion, in which case the Context Group shall consist of the transitive closure of the set of all coded concepts within the included Context Groups.

Note

For example, it is reasonable to have the following definitions for context groups:

• Context ID 1, includes Context IDs 2 and 3
• Context ID 2, includes Context IDs 4 and 5
• Context ID 3, includes Context IDs 5 and 6
• Context ID 4 contains a, b, c
• Context ID 5 contains e, f, g
• Context ID 6 contains a, h, i

The contents of Context ID 1 will be a, b, c, e, f, g, h, i.

Table 7.2.1-1. Include Context Group Macro

<table>
<thead>
<tr>
<th>Coding Scheme Designator</th>
<th>Code Value</th>
<th>Code Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>...</td>
<td>...</td>
<td>...</td>
</tr>
<tr>
<td>Include CID nnn</td>
<td>...</td>
<td>...</td>
</tr>
</tbody>
</table>

7.2.2 Units of Measurement

Context Group 82 is defined to include all units of measurement relevant to DICOM IODs. In the past it was envisaged that an extensible list of pre-coordinated codes would be included in the mapping resource.

DICOM has now adopted the Unified Codes for Units of Measurement (UCUM) standard for all units of measurement. This coding scheme allows for the "construction" of pre-coordinated codes from atomic components.

The specialization of the UCUM standard as it is used in DICOM involves the following rules:

• the Coding Scheme Designator is specified as "UCUM"
• the version of UCUM from which a code is constructed is not required, as it is not needed to resolve ambiguity in the Code Value or Code Meaning; however, there is no restriction on the version being specified in Coding Scheme Version
• the Code Value will be constructed from UCUM and make use of the "case-sensitive" form of UCUM code (e.g., "ml/s")
• the Code Meaning for other than UCUM unity may be one of the following:
  • the "print" value specified in UCUM (e.g., "mmHg" for Code Value mm[Hg])
• the same string as sent in the Code Value (e.g., "ml/s")

• constructed from the "names" of individual components using the Americanized form of name (e.g., "milliliters/second")

• constructed from the "names" of individual components using the European form of name (e.g., "millilitres/second")

• In the case of UCUM unity ("1", or curly braces expression) it is forbidden to use "1" as a Code Meaning. Annex G provides Code Meanings for a Code Value (0008,0100) of 1. A Template or Context Group may constrain the Code Meaning according to the following rules:

  • UCUM default unit 1 shall use one of the Code Meaning synonyms specified in Annex G

  • ratios of identically dimensioned values may use ([ratio], UCUM, "ratio")

  • unitless numeric scores may use ([M:N], UCUM, "range: M:N") to specify the minimum and maximum value, for example, ([0:10], UCUM, "range: 0:10")

  • counts using UCUM annotation shall always use the text within the curly braces as the Code Meaning, for example, ([masses], UCUM, "masses")

  • compositions of a curly braces expression with other UCUM values may use a conventional clinical representation, for example, ([H.B.]/min, UCUM, "BPM")

The UCUM standard states that the preferred display values for codes deg (degrees of plane angle) and Cel (degrees Celsius) are "°" and "°C". However, the character ° does not have a representation in the DICOM default character set (ASCII, ISO-IR 6). The Code Meaning specified in this Part therefore uses "deg" and "C". SOP Instances that specify a Specific Character Set that allows the character ° may use Code Meanings "°" and "°C".

Note

1. Code Meaning "C" formally conflicts with the Code Meaning for Coulomb. In the context of DICOM use, the possibility of confusion to a user based on the display of the Code Meaning is considered remote, as there is little use of Coulomb in imaging, and the context of the displayed item Concept Name would resolve between temperature and electric charge. Automated processing based on the Code Values should not face an issue as the Code Values differ.

2. The character ° has Unicode code point U+00B0, and is represented as 0xB0 in ISO-IR 100 (Latin-1), ISO-IR 101 (Latin-2), ISO-IR 109 (Latin-3), ISO-IR 110 (Latin-4), ISO-IR 126 (Greek), ISO-IR 138 (Hebrew), and ISO-IR 148 (Latin-5). It is not encodable in ISO-IR 13 (Katakana), ISO-IR 144 (Cyrillic), ISO-IR 127 (Arabic), or ISO-IR 166 (Thai).

7.2.3 Extension of Context Groups

An Application may extend an Extensible Context Group by adding terms for new concepts. Applications may not substitute other terms of the same concept in the Context Group. Applications may not add a term that means "unspecified" or "missing" or "unknown" similar; if such a concept is intended to be permitted then the Standard will include it in the Context Group already. Such extension may be made without a change in Context Group Identifier, but with the specification of Context Group Extensions (see PS3.3).

Non-extensible Context Groups shall not be modified in an Application.

Note

The set of concepts in either an Extensible or a Non-extensible Context Group may be changed in subsequent editions of the Standard, in accordance with the procedures of the DICOM Standards Committee.
8 Coding Schemes

Table 8-1 lists the coding schemes (and their designators) defined for use in DICOM; Table 8-2 lists the HL7v3 coding schemes referenced for use in DICOM. Additionally, any coding scheme may be used that has an entry in the HL7 Registry of Coding Schemes (HL7 v2 Table 0396, or the equivalent online registry), in which case the HL7 Symbolic Name shall be used as the value for the Coding Scheme Designator in DICOM, as long as it does not conflict with an entry Table 8-1 and fits within the Value Representation of the DICOM Coding Scheme Designator (0008,0102) attribute. As specified in the HL7 v2 Table 0396, local or private coding schemes shall be identified by an alphanumeric identifier beginning with the characters "99".

Note

1. An earlier version of this table was formerly contained in Annex D of PS3.3.
2. See Section 8.2 "Coding Scheme Designator and Coding Scheme Version" in PS3.3 for further description.
3. The Coding Scheme UIDs are provided for reference only; the normative specification of UIDs and their associated meaning is the responsibility of the coding scheme developer and/or HL7.
4. The current version of HL7 v2 Table 0396 is available at http://www.hl7.org/special/committees/vocab/table_0396/index.cfm.
5. The HL7 registration of Coding Schemes is available at http://www.hl7.org/oid/index.cfm.
6. Publication of codes or references to coding schemes within DICOM does not constitute a grant of intellectual property rights to implementers. Use of some Coding Schemes may require a license, or purchase of the relevant coding scheme publication. Implementers should consult the relevant coding scheme publisher; see also Section 2.
7. The values of Coding Scheme Name (0008,0115), Coding Scheme Responsible Organization (0008,0116) and Coding Scheme Resources Sequence (0008,0109), if available, may be used to fill the corresponding optional attributes of the Coding Scheme Identification Sequence (0008,0110) in the Section C.12.1 “SOP Common Module” in PS3.3.

Note

The HL7 OID Registry specifies "rfc5646", not "ietf5646", as the Desired Symbolic Name (inconsistent with the pattern used for [RFC 4646]).

[RFC 5646] constitutes one part of IETF Best Current Practice BCP 47, Tags for Identifying Languages, which also includes [RFC 4647] Matching of Language Tags; [RFC 4647] is not relevant in this context.

[RFC 5066] has been superseded by [RFC 4646], which in turn has been superseded by [RFC 5646].

[RFC 5646] constitutes one part of IETF Best Current Practice BCP 47, Tags for Identifying Languages, which also includes [RFC 4647] Matching of Language Tags; [RFC 4647] is not relevant in this context.

HL7 uses "IETF3066" for the symbolic name.

8.1 SNOMED

SNOMED (the Systematized Nomenclature of Medicine) is the preferred coding system within DICOM for anatomy, clinical findings, procedures, pharmaceutical/biologic products (including contrast agents), and other clinical terms.

Note

HL7 uses “SNM” for the symbolic name.
SNOMED has had various versions, including SNOMED International (Version 3), which was issued in 1993 and revised through 1998, SNOMED Reference Terminology, the successor to SNOMED 3 that was published between 1999 and 2001, and SNOMED Clinical Terms, which has been the name since 2002. The coding scheme is fully backward-compatible across SNOMED 3, SNOMED-RT, and SNOMED CT. SNOMED CT introduced a solely numeric set of codes (ConceptID) in addition to the former alphanumeric codes (SnomedID), but all SNOMED terminology concepts have both a numeric and an alphanumeric code.

In previous editions of the DICOM Standard, the following Coding Scheme Designators were used for SNOMED codes in DICOM:

- "99SDM", denoting the provisional SNOMED DICOM Microglossary
- "SNM3", denoting SNOMED International (Version 3)
- "SRT", originally denoting SNOMED-RT

All uses of SNOMED coded terms in DICOM are now indicated by the Coding Scheme Designator "SRT", identifying them as SNOMED CT terms using the "SNOMED-RT style" alphanumeric code values, with some exceptions:

- The Section A.5 “Nuclear Medicine Image IOD” in PS3.3 and Section A.21 “Positron Emission Tomography Image IOD” in PS3.3 in some code sequences require the Coding Scheme Designator "99SDM" as an Enumerated Value (see PS3.3).

- The Mammography View Codes of CID 4014 “View for Mammography” and CID 4015 “View Modifier for Mammography” may use the Coding Scheme Designator "SNM3" for implementation adherence to regulatory approvals.

Consequently, when a Coding Scheme Designator of "99SDM" or "SNM3" is encountered, it shall be treated as equivalent to "SRT" for the purpose of interpreting the Code Value.

Note

"SRT" as a coding scheme designator is used only in the DICOM Standard. HL7v2 did not standardize a coding scheme designator for SNOMED-RT.

When interoperating with systems that use SNOMED CT codes obtained from a source other than the DICOM Standard, Application Entities may receive Code Sequences with a Coding Scheme Designator of "SNOMED-CT" and a numeric ConceptID code. It is the responsibility of such Application Entities to convert any such codes to the alphanumeric SnomedID with Coding Scheme Designator "SRT" for use in DICOM objects and services.

8.1.1 Use of SNOMED Anatomic Concepts

In general, DICOM uses the anatomic concepts with the term "structure", rather than with the term "entire". This is an important distinction in SNOMED. "Entire" is a child concept to "structure", has a more restricted meaning, and typically is used in conjunction with treatments (e.g., "excision of entire right kidney"). It is used in distinction to other sibling children of the parent concept that may identify parts of the parent anatomic feature. Since imaging typically targets both the anatomic feature and the area around it, or sometimes just part of the anatomic feature, DICOM usually uses "structure" concepts that are more inclusive than the "entire" concepts.

8.2 ISO_OID

[ISO 8824-1] and [ISO 9834-1] are the standards defined for the generation of object identifiers that are used as DICOM Unique Identifiers (see PS3.5), can also serve as a general mechanism for identifying organizations and objects defined by those organizations.

When the Coding Scheme Designator is ISO_OID, the Code Value shall be the numeric (dot delimited) form of a valid object identifier.

A repository of known existing object identifiers can be found at http://www.oid-info.com/index.htm. For example:

- the ISO 9834-1 assigned numeric object identifier for the country France, is "1.0.3166.2.2.1.250" (since ISO 3166 defines a means for maintaining country codes using object identifiers)
- the object identifier for the RIPEMD-160 cryptographic hash function is "1.0.10118.3.0.49"
- the object identifier for the HL7 V2 table of codes for marital status is "2.16.840.1.113883.12.2"
The re-use of object identifiers for existing concepts that do not have an alternative more appropriate coding scheme compatible with DICOM provides a mechanism to avoid defining new codes. For example, HL7 assigned object identifiers can be found at http://www.hl7.org/oid/index.cfm.

Though the intent of ISO_OID is to define organizational roots for the hierarchical assignment of object identifiers, and not specifically to identify organizations per se, the organizational root values can be construed as identifying the organization. For example, the DICOM Standards Organization itself can be identified by the value "1.2.840.10008". See also CID 5002 "Organizations".
A Structured Reporting Templates (Normative)

This Annex specifies the content of Standard Templates that may be used by DICOM SR IODs.

General Templates

TID 300 Measurement

This Template provides a general structure for a numeric measurement, together with evaluations of its normality and/or significance, and the inference source(s) for its value. This structure is instantiated by inclusion of this Template with specific contextual parameters from a parent Template.

Table TID 300. Parameters

Content Item Descriptions

Rows 2, 3, 4, 5 The HAS CONCEPT MOD items allow the explicit definition of terms for post-coordination of the measurement concept name. Additional post-coordinated modifier terms may be included in a SOP Instance based on this Template, in accordance with section 6.2.4, or as defined by Templates that invoke this Template and explicitly define additional post-coordinated modifiers (e.g., TID 5203).

Row 5 Finding site may be multiple when a region of interest spans multiple anatomical locations and there is not a single pre-coordinated code describing the combination of locations. E.g., when a malignant, inflammatory or traumatic process spans actual or defined anatomical boundaries. There is no requirement that the multiple locations be contiguous.

Rows 9, 10 The INFERRED FROM items allow the specification (by-value or by-reference) of numeric values that were used in the derivation of the numeric measurement of Row 1. The nature of the inference is not explicitly conveyed; it may be implicit in the Concept Names of the measurements. Inference by-reference is valid only in SOP Classes that permit the INFERRED FROM relationship by-reference.
Equivalent Meaning of Concept Name allows the creating application to specify the preferred composed concept name representing the measurement and the associated post-coordinated concept modifiers. The concept modifiers may include those specified in this Template, in a Template that invokes this Template, or at the option of the creating application in accordance with section 6.2.4. This composed concept name may be rendered by a display application.

Row 18 is a reference to an RWV that describes how measurements were made in units that differ from the stored pixel values in the images referenced in Row 13. E.g., for a PET SUVbw measurement, the mapping from activity/concentration units in the referenced image that was used (and which may be reused for measurements in the future) may be encoded in a referenced RWV instance. This reference overrides any reference in an including Template (such as for a Measurement Group).

**TID 310 Measurement Properties**

This Template provides the properties of a numeric measurement, including evaluations of its normality and/or significance, its relationship to a reference population, and an indication of its selection from a set of measurements.

</tbody>
</table>

Content Item Descriptions

Row 2
The HAS PROPERTIES allows the specification of the numeric values used as input to the equation or table identified in Row 1.

Row 3
The HAS PROPERTIES allows the specification by-reference of the numeric values used as input to the equation or table. This row is valid only in SOP Classes that permit the HAS PROPERTIES relationship by-reference.

Note
For example, if Row 1 identifies a specific Body Surface Area equation, Rows 2 and 3 can be used to convey (by-value or by-reference) the Patient Height and Patient Weight numeric measurements used in the BSA computation.

TID 320 Image or Spatial Coordinates

This Template provides a general structure for inference from an image, either as a whole, or with specific spatial coordinates, as a single included Template in the invoking Template. If allowed by the IOD, the Image Content Item may be included by-reference.

### TID 1000 Quotation

Unless otherwise specified, content in an SR tree is "directly" observed. When material is quoted (from a source that is either a document or something spoken), then it is necessary to specify:

- the fact that one is quoting
- who is doing the quoting
- the source of the quote
- who is being quoted, and who and what the quote is about

This Template establishes a mechanism for quoting by specifying:

- the fact that one is quoting, by the presence of the contents of the Template in the tree
- that the "observer context" above the invocation of this Template establishes who is doing the quoting
- the source of the quote, by the values of the Content Items in this Template
- who is being quoted, and who and what the quote is about, by the observation context that is established at the start of the quoted material

This Template may be invoked recursively, to nest quotes within quotes. In essence, the chain of who is quoting whom can be established by maintaining a "stack" of observer context.

If a dimension of observation context is the same in the quoted material as in the enclosing tree, then the observation context does not need to be respecified (e.g., the quote may be about the same subject or procedure). Typically, the observer context would change (unless one were quoting oneself).

In the case of quoting something that was spoken, the "observer" is the person speaking.

TID 1000 is attached using HAS OBS CONTEXT relationships to the top node of the material that is being quoted. The presence of the Quoted Source concept signals the fact that the material is quoted rather than directly observed.

**Type:** Extensible  
**Order:** Significant  
**Root:** No

<td></td>
<td></td>
</tr>
</tbody>
</table>

### TID 1001 Observation Context

Specifies attributes of observation context that may be defined, extended or replaced at any location in the SR tree.

This includes attributes that specify:

- who or what the observation is about ("subject context")
- what procedure the observation is about ("procedure context")
- who or what is making the observation ("observer context")

Establishing context includes two aspects of each dimension: identification and description (e.g., patient name and ID vs. patient's age, height or weight).

Whenever one dimension of context is changed or an attribute is added, all attributes of that dimension of context are "flushed", that is they need to be repeated in their entirety. For example, when the subject is changed from patient (name, id) to fetus (number), then the parameters of the patient are discarded. E.g., the patient's ID does not apply to the fetus.

"Extending" the same class and dimension of observation context isn't feasible, since one cannot "null out" or remove a previously set attribute. Any time a dimension of observation context is "replaced", any attributes that are unspecified remain unspecified (i.e., they are not inherited).

**Type:** Non-Extensible  
**Order:** Significant  
**Root:** No

### Table TID 1001. Observation Context

<td></td>
</tr>
</tbody>
</table>
TID 1002 Observer Context

The observer (person or device) that created the Content Items to which this context applies.

Whenever this Template is invoked, all previously inherited attributes of Observer Context are discarded and replaced.

There may be more than one observer, as this Template may be invoked with a VM 1-n, and both person and device observers. In such a case, the Content Items of TID 1003 “Person Observer Identifying Attributes” and TID 1004 “Device Observer Identifying Attributes” shall be included in the order in which the values of Observer Type are specified. Since TID 1003 “Person Observer Identifying Attributes” and TID 1004 “Device Observer Identifying Attributes” both include a single mandatory Content Item as their first Content Item, which observer is being described can be determined.

</table>
If the device performing the observations has other roles, e.g., as the irradiating device in a dose report, this may be recorded here, if not implicit.

**TID 1005 Procedure Context**

This Template contains identifying (and optionally descriptive) attributes of the procedure that is the source of evidence being interpreted. Whenever this Template is invoked, all previously inherited attributes of Procedure Context are discarded and replaced.

**Note**

If an observed digital image is identified by other than a DICOM UID, a Study Instance UID must be generated for the non-DICOM evidence. The same must be done to document interpretation of hard-copy radiographs generated outside of the scope of the DICOM system.

**TID 1021 Device Participant**

This Template describes a device participating in an activity as other than an observer or subject. E.g., for a dose report documenting an irradiating procedure, participants include the irradiating device.

This Template is included with specific contextual parameters from a parent Template.
Table TID 1021. Parameters

**Content Item Descriptions**

- **Row 1**: If no Device Procedure Role is provided, BCID 7445 “Device Participating Roles” may be used.
- **Row 2**: This may be used for the name by which the organization manages the device.

### TID 1200 Language Designation

Defines a mechanism for specifying a language, optionally with designation of the country in which that language applies.

**Note**

1. For example, the French language could be specified unmodified, or French as written in France or Canada could be distinguished.

2. The language codes specified in CID 5000 “Languages” optionally allow the encoding of the country of language in the code value for the language. Encoding of the country of language in a separate subsidiary Concept Modifier Content Item is allowed for backward compatibility with previous editions of the Standard.

### Table TID 1200. Language Designation

</tbody>
</table>
TID 1201 Language of Value

Defines a mechanism for specifying the language in which the value of the parent Content Item (only) is written. Does not specify the language of the Concept Name of the parent Content Item, nor of any other descendants of the parent Content Item.

Note

The language codes specified in CID 5000 “Languages” optionally allow the encoding of the country of language in the code value for the language. Encoding of the country of language in a separate subsidiary Concept Modifier Content Item is allowed for backward compatibility with previous editions of the Standard.

Table TID 1201. Language of Value

</tbody>
</table>

TID 1202 Language of Name and Value

Defines a mechanism for specifying the language in which the value and the Concept Name of the parent Content Item (only) is written. Does not specify the language of any other descendants of the parent Content Item.

Note

The language codes specified in CID 5000 “Languages” optionally allow the encoding of the country of language in the code value for the language. Encoding of the country of language in a separate subsidiary Concept Modifier Content Item is allowed for backward compatibility with previous editions of the Standard.

Table TID 1202. Language of Name and Value

</tbody>
</table>

TID 1204 Language of Content Item and Descendants

Defines a mechanism for specifying the language in which the value and the Concept Name of the parent Content Item and any other descendants of the parent Content Item is written.

Note

The language codes specified in CID 5000 “Languages” optionally allow the encoding of the country of language in the code value for the language. Encoding of the country of language in a separate subsidiary Concept Modifier Content Item is allowed for backward compatibility with previous editions of the Standard.

Type: Non-Extensible
Order: Significant
### Table TID 1204. Language of Content Item and Descendants

<tr>
<td>4</td>
<td>&gt;</td>
<td>INCLUDE</td>
<td>DTID 1201 “Language of Value”</td>
<td>1</td>
<td>U</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note**

A coded equivalent meaning for the Concept Name can also be included using the attribute Equivalent Code Sequence (0008,0121) in the Concept Name Code Sequence (0040,A043) (see Section 8.9 “Equivalent Code Sequence” in PS3.3), though the equivalent code(s) in the Equivalent Code Sequence (0008,0121) need not be the same as those in TID 1210.

### TID 1211 Equivalent Meaning(s) of Value

Defines a mechanism for specifying one or more equivalent meanings for the Value of the parent Content Item.

**Type:** Extensible  
**Order:** Significant  
**Root:** No
### Table TID 1211. Equivalent Meaning(s) of Value

<table>
<thead>
<tr>
<th>NL</th>
<th>Rel with Parent</th>
<th>VT</th>
<th>Concept Name</th>
<th>VM</th>
<th>Req Type</th>
<th>Condition</th>
<th>Value Set Constraint</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>HAS CONCEPT MOD</td>
<td>TEXT</td>
<td>EV (121051, DCM, &quot;Equivalent Meaning of Value&quot;)</td>
<td>1-n</td>
<td>MC</td>
<td>XOR Row 3</td>
<td>Plain text equivalent of code meaning of the value of the Content Item being modified, in the specified language from the specified country, using the default character set or a character set selected from Specified Character Set</td>
</tr>
<tr>
<td>2</td>
<td>&gt;</td>
<td>INCLUDE</td>
<td>DTID 1201 “Language of Value”</td>
<td>1</td>
<td>U</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>HAS CONCEPT MOD</td>
<td>CODE</td>
<td>EV (121051, DCM, &quot;Equivalent Meaning of Value&quot;)</td>
<td>1-n</td>
<td>MC</td>
<td>XOR Row 1</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>&gt;</td>
<td>INCLUDE</td>
<td>DTID 1201 “Language of Value”</td>
<td>1</td>
<td>U</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note**

1. For example, to describe a longer, more meaningful equivalent (in the same language) for a procedure code than is defined in a coding scheme:

   CODE: (121023, DCM, "Procedure Code") = (50291CC, ICD10PCS, "IMAGING:CNS:CT:SELLA:LOWOSMOLAR:IT, U, E:2PLANE3D")

   > HAS CONCEPT MOD TEXT: (121051, DCM, "Equivalent meaning of value") = "imaging study central nervous system of the sella turcica/pituitary gland with low osmolar contrast intrathecal, unenhanced and enhanced, in two planes with 3D reconstructions"

2. For example, to specify a concept name and value in both French and English in Canada:

   CODE: (T-D0005, SRT, "Anatomical structure") = (T-04000, SRT, "Breast")

   > HAS CONCEPT MOD CODE: (121048, DCM, "Language of name and value") = (en-CA, RFC3066, "English, Canada")

   > HAS CONCEPT MOD CODE: (121050, DCM, "Equivalent meaning of concept name") = (T-D0005, SRT, "Structure de l'anatomie")

   >> HAS CONCEPT MOD CODE: (121047, DCM, "Langue de la valeur") = (fr-CA, RFC3066, "Français, Canadien")

   > HAS CONCEPT MOD CODE: (121051, DCM, "Equivalent meaning of value") = (T-04000, SRT, "Sein")

   >> HAS CONCEPT MOD CODE: (121047, DCM, "Langue de la valeur") = (fr-CA, RFC3066, "Français, Candien")

3. A coded equivalent meaning for the Concept Value of a CODE Content Item can also be included using the attribute Equivalent Code Sequence (0008,0121) in the Concept Code Sequence (0040, A168) (see Section 8.9 “Equivalent Code Sequence” in PS3.3).

### TID 1350 Negation Modifier, Presence of Finding

Concept Name Modifier for negation of the presence of a finding represented by a post-coordinated concept.

**Note**

1. For example, negation modifier applied to "distention" in the post-coordinated structure:

   CODE: "anatomic location" = "bile duct"
HAS PROPERTY CODE: "morphology" = "distention"

HAS CONCEPT MOD CODE: "presence of property" = "absent"

means: "bile duct distention not present"

2. The presence-negation modifier modifies the entire post-coordinated concept, not just the Source Content Item of the HAS CONCEPT MOD relationship. The entire branch of the tree from the Content Item is included in the post-coordinated structure that is negated.

Table TID 1350. Negation Modifier, Presence of Finding

<td></td>
<td></td>
</tr>
</tbody>
</table>

Content Item Descriptions

Row 2 | Path shall represent the measured path or a projection of the measured path in the image. The Graphic Type (0070,0023) of the Path SCOORD shall be:

- an open POLYLINE with two different points (to measure length, diameter, distance, proximity, etc),
- a CIRCLE or ELLIPSE (to measure circumference) or
- an open or closed POLYLINE (closed polygon) to measure path length (open) or perimeter (closed).
A measured path that traverses two or more images (e.g., the ends of the path are in different cross-sectional plane images) shall be identified by vertices along the path. The Path Vertices shall be ordered by the order of their SCOORD Content Items to identify the measured path. The Graphic Type (0070,0023) of each SCOORD shall be POINT.

<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Content Item Descriptions

**Row 2 “Area Outline”**
A Graphic Type of POINT implies that the object is a single pixel and the object's area is the area of the pixel. Otherwise the type shall be a closed POLYLINE (start and end point the same) or a CIRCLE or an ELLIPSE.

**Rows 5, 6**
Referenced Frame Number (0008,1160) is an attribute of the IMAGE Content Item.

If the Referenced Segmentation SOP Instance has Segmentation Type (0062,0001) value BINARY, it identifies the area of defined (measured) region by pixel values in the referenced frame with value 1. For Segmentation Type value FRACTIONAL, the area is computed by an implementation dependent method.

Frame number shall be specified even if the Segmentation SOP Instance has only a single frame.
### TID 1402 Volume Measurement

**Type:** Extensible  
**Order:** Significant  
**Root:** No

#### Table TID 1402. Volume Measurement

<tr>
<td>8</td>
<td>&gt;</td>
<td>INCLUDE</td>
<td>DTID 4108 “Tracking Identifier”</td>
<td>1</td>
<td>U</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Content Item Descriptions

**Row 2 "Perimeter Outline"**  
The two dimensional perimeter of the volume's intersection with or projection into the image. A Graphic Type of POINT implies that the volume's intersection or projection in a plane is a single pixel. A single pixel projection perimeter cannot cause a volume calculation to become 0. Otherwise the type shall be a closed POLYLINE (start and end point the same) or a CIRCLE or an ELLIPSE.

**Rows 5, 6**  
Referenced Segment Number (0062,000B) is an attribute of the IMAGE Content Item.  
If the Referenced Segmentation SOP Instance has Segmentation Type (0062,0001) value BINARY, it identifies the defined (measured) volume by pixel/voxel values in the frames of the referenced segment with value 1. For Segmentation Type value FRACTIONAL, the volume is computed by an implementation dependent method. Segment number shall be specified even if the Segmentation SOP Instance has only a single segment.

**Row 8**  
The values of (112039, DCM, "Tracking Identifier") and (112040, DCM, "Tracking Unique Identifier"), if present, shall match the corresponding values of Tracking ID (0062,0020) and Tracking UID (0062,0021), if present, in the corresponding Segment of any Segmentation instance referenced in Row 5.

Rows 5, 6
Path shall represent the measured path in a reference coordinate space. The Graphic Type (0070,0023) of the Path SCOORD3D shall be:

- an open POLYLINE with two or more different (x,y,z) triplets (to measure length, diameter, distance, proximity, etc.),
- an ELLIPSE (to measure circumference) or
- a closed POLYGON to measure perimeter, where the (x,y,z) triplets are coplanar.

TID 1410 Planar ROI Measurements

This Template provides a general structure to report one or more measurements for some metric, e.g., density, flow, or concentration, over a planar region of interest in an image. The ROI may be specified by an SCOORD on an image, or by a Segmentation Image.

Content Item Descriptions

Row 1b  Identifies the session during which the measurements were made. The NCI Thesaurus definition is "time, period, or term devoted to some activity".

Rows 2, 3  The Tracking Identifier and Tracking Unique Identifier are defined as a text label or unique identifier (respectively) used for tracking a finding or feature, potentially across multiple reporting objects, over time. As such, they are distinct from the Observation UID (0040.A171), which is unique identifier of the specific Content Item and its subsidiary Content Items that constitute an individual observation, and would be different for different observations on different occasions of the same finding or feature. The values of these content items shall match the corresponding values of Tracking ID (0062.0020) and Tracking UID (0062.0021), if present, in the corresponding Segment of any Segmentation instance referenced in Row 7.

Row 3b  The type of the finding describes whatever entity (finding or feature) is identified by Rows 2 and 3. E.g., a finding might be a lesion, a tumor, or a reference region (as distinct from its anatomical location, which is encoded in a different content item (Finding Site)).

Rows 6, 7  Referenced Frame Number (0008.1160) is an attribute of the IMAGE Content Item, and shall be present with a single value.

If the Referenced Segmentation SOP Instance has Segmentation Type (0062.0001) value BINARY, it identifies the area of defined (measured) region of interest by pixel values in the referenced frame with value 1. For Segmentation Type value FRACTIONAL, the area is computed by an implementation dependent method.

Frame number shall be specified even if the Segmentation SOP Instance has only a single frame.

Row 8  Identifies the source image that was segmented to identify the ROI, and whose properties are described in this container.

Row 9  This referenced image may contain a "screen shot" illustrating a rendered version of the ROI.

Row 10  The reference to an RWV in Row 10 allows measurements to be made in units that differ from the stored pixel values in the images referenced elsewhere in the Template. E.g., for a PET SUVbw measurement, the mapping from activity/concentration units in the referenced image that was used (and which may be reused for measurements in the future) may be encoded in a referenced RWV instance. This reference applies to any measurements in included Templates, unless overridden.

Rows 12, 13  Allows encoding a flat list of name-value pairs that are coded questions with coded or text answers, for example, to record categorical observations related to the subject of the measurement group.

TID 1411 Volumetric ROI Measurements

This Template provides a general structure to report one or more measurements for some metric, e.g., density, flow, or concentration, over a volumetric region of interest in a set of images or a Frame of Reference. The volumetric ROI may be specified by a set of SCOORDs on an image set representing a volume, by a volumetric Segmentation Image, by a volume defined in a Surface Segmentation, or by a SCOORD3D.

| $Measurement | Coded term or Context Group for Concept Name of measurement |
| $Units | Units for the measurement |
| $ModType | Modifier Name for Concept Name of measurement |
| $ModValue | Modifier Value for Concept Name of measurement |
| $Method | Value for Measurement Method |
| $Derivation | Value for Measurement Derivation |
| $TargetSite | Value for Anatomic Location of measurement |
| $TargetSiteMod | Modifier Value for Anatomic Location of measurement |
| $Equation | Coded term or Context Group for the equation or table from which the measurement was derived or computed |
| $RefAuthority | Bibliographic reference or authority for statistical properties of a reference population |

**Content Item Descriptions**

**Row 1b**
Identifies the session during which the measurements were made. The NCI Thesaurus definition is “time, period, or term devoted to some activity”.

**Rows 2, 3**
The Tracking Identifier and Tracking Unique Identifier are defined as a text label or unique identifier (respectively) used for tracking a finding or feature, potentially across multiple reporting objects, over time. As such, they are distinct from the Observation UID (0040,A171), which is unique identifier of the specific Content Item and its subsidiary Content Items that constitute an individual observation, and would be different for different observations on different occasions of the same finding or feature. The values of these content items shall match the corresponding values of Tracking ID (0062,0020) and Tracking UID (0062,0021), if present, in the corresponding Segment of any Segmentation instance referenced in Row 7.

**Row 3b**
The type of the finding describes whatever entity (finding or feature) is identified by Rows 2 and 3. E.g., a finding might be a lesion, a tumor, or a reference region (as distinct from its anatomical location, which is encoded in a different content item (Finding Site).
Referenced Segment Number (0062,000B) is an attribute of the IMAGE Content Item, and shall be present with a single value.

If the Referenced SOP Instance is a Segmentation Image, it shall have a defined Frame of Reference. If it has Segmentation Type (0062,0001) value BINARY, it identifies the volume of defined (measured) region of interest by voxel values in the referenced segment with value 1. If it has Segmentation Type value FRACTIONAL, the volume is defined by an implementation dependent method.

If the referenced SOP Instance is a Surface Segmentation, the referenced segment shall constitute a finite volume. It identifies the volume of the defined (measured) region of interest by the interior of the finite volume.

Segment number shall be specified even if the Segmentation SOP Instance has only a single segment.

Row 11
Identifies the source images that were segmented to identify the ROI, when, for example a subset of images in a series was used.

Row 12
Identifies the source series of images that were segmented to identify the ROI, when, for example an entire set of images in a series was used.

Row 13
These referenced images may contain "screen shot" illustrating rendered versions of the ROI.

Row 14
The reference to an RWV in Row 14 allows measurements to be made in units that differ from the stored pixel values in the images referenced elsewhere in the Template. E.g., for a PET SUVbw measurement, the mapping from activity/concentration units in the referenced image that was used (and which may be reused for measurements in the future) may be encoded in a referenced RWV instance. This reference applies to any measurements in included Templates, unless overridden).

Rows 16, 17
Allows encoding a flat list of name-value pairs that are coded questions with coded or text answers, for example, to record categorical observations related to the subject of the measurement group.

**TID 1419 ROI Measurements**

This Template encodes measurements for some metric, e.g., density, flow, or concentration.

**Content Item Descriptions**
Rows 2, 9  
Finding site may be multiple when a region of interest spans multiple anatomical locations and there is not a single pre-coordinated code describing the combination of locations. E.g., when a malignant, inflammatory or traumatic process spans actual or defined anatomical boundaries. There is no requirement that the multiple locations be contiguous.

Row 5  
Specifies the metric for which measurements are reported, e.g., density, flow, or concentration. This metric is computed at each sample point (e.g., pixel or voxel) in an ROI (defined in the invoking Template), but those individual point measurements are not encoded. Instead, just the summary measurements for the ROI are encoded, and the means of computing a single value is defined in Row 8 Derivation (e.g., mean).

Rows 1, 2, 3, 4, 6, 7, 8, 9, 10, 11  
The HAS CONCEPT MOD items allow the explicit definition of terms for post-coordination of the measurement concept name. Additional post-coordinated modifier terms may be included in a SOP Instance based on this Template, in accordance with section 6.2.4, or as defined by Templates that invoke this Template and explicitly define additional post-coordinated modifiers.

Rows 13, 14  
The INFERRED FROM items allow the specification (by-value or by-reference) of numeric values that were used in the derivation of the numeric measurement of Row 1. The nature of the inference is not explicitly conveyed; it may be implicit in the Concept Names of the measurements. Inference by-reference is valid only in SOP Classes that permit the INFERRED FROM relationship by-reference.

Row 18  
Equivalent Meaning of Concept Name allows the creating application to specify the preferred composed concept name representing the measurement and the associated post-coordinated concept modifiers. The concept modifiers may include those specified in this Template, in a Template that invokes this Template, or at the option of the creating application in accordance with section 6.2.4. This composed concept name may be rendered by a display application.

Row 19  
The reference to an RWV in Row 19 allows measurements to be made in units that differ from the stored pixel values in the images referenced in the parent Template. E.g., for a PET SUVbw measurement, the mapping from activity/concentration units in the referenced image that was used (and which may be reused for measurements in the future) may be encoded in a referenced RWV instance. This reference overrides any reference in an including Template (such as for a Measurement Group).

**TID 1420 Measurements Derived From Multiple ROI Measurements**

This Template encodes measurements for some metric, e.g., density, flow, or concentration, which are acquired over some defined sampling (e.g., over successive time slots in a dynamic contrast enhanced acquisition).

**Content Item Descriptions**

**Row 1**
Specifies the type of derived measurement reported, e.g., the mean of the individual ROI mean density values. Note that the units may be different from the units in the ROI measurements.

**Rows 2, 3**
The measurement values of each ROI that contributes to the derived measurement, e.g., the mean density within an ROI. These are specified by reference, so as to not have to repeat the ROI information when it contributes to multiple derived measurements (e.g., if both mean and SD of ROI mean density values were specified).

**TID 1500 Measurement Report**

This Root Template encodes a list of Measurement Groups each containing lists of measurements, together with any derived measurements.

Each Measurement Group is identified by Tracking ID and UIDs.

An image library is available to describe characteristics of the images referenced by the measurements, if any.

**Type:** Extensible

## Content Item Descriptions

Rows 6, 10, 12  
The conditions require that at least one of the "heading" containers be present, though any of them may be present but empty.

Rows 7, 8, 9  
The baseline context groups defined allow for generic intensity, size and texture measurements, regardless of the geometry of the ROI (e.g., linear distance can be measured on volumes, or volume can be estimated from a linear distance), and being baseline, do not constrain the invoker from using other appropriate concepts specific to the application.

Row 9  
A Measurement Group is used to contain one or more individual measurements that are invocations of TID 300, consistent with TIDs 1410 and 1411, which both already have Measurement Group containers as their roots.

Rows 12, 13, 14  
These Content Items allow encoding a flat list of name-value pairs that are coded questions with coded or text answers, for example, to record categorical observations related to the entire subject of the report rather than specific measurement groups.

## TID 1501 Measurement Group

This Template groups Measurements into a Measurement Group.

Each Measurement Group is identified by Tracking ID and UIDs, and may be described as having being made at a particular time point.

Measurement groups may contain various common measurement modifiers that are shared by all measurements in the group, such as method and finding site.

**Content Item Descriptions**

**Row 1b**
Identifies the session during which the measurements were made. The NCI Thesaurus definition is "time, period, or term devoted to some activity".

**Rows 2, 3, 10**
The included TID 300 already contains an optional inclusion of TID 1408 Tracking Identifier, which in turns allows for either or both Tracking Identifier and Tracking Unique Identifier Content Items; the intent of Rows 2 and 3 is not to send these Content Items twice, but rather to specialize their use such that their presence is mandatory, consistent with TIDs 1410 and 1411.

**Row 3b**
The type of the finding describes whatever entity (finding or feature) is identified by Rows 2 and 3. E.g., a finding might be a lesion, a tumor, or a reference region (as distinct from its anatomical location, which is encoded in a different content item (Finding Site).

**Row 6**
Finding site may be multiple when a region of interest spans multiple anatomical locations and there is not a single pre-coordinated code describing the combination of locations. E.g., when a malignant, inflammatory or traumatic process spans actual or defined anatomical boundaries. There is no requirement that the multiple locations be contiguous.
The reference to an RWV in Row 9 allows measurements to be made in units that differ from the stored pixel values in the images referenced elsewhere in the Template. E.g., for a PET SUVbw measurement, the mapping from activity/concentration units in the referenced image that was used (and which may be reused for measurements in the future) may be encoded in a referenced RWV instance. This reference applies to any measurements in included Templates, unless overridden.

Rows 11, 12 allows encoding a flat list of name-value pairs that are coded questions with coded or text answers, for example, to record categorical observations related to the subject of the measurement group.

TID 1502 Time Point Context

This Template describes information about the time point, for example, at which a measurement was obtained.

<td></td>
<td></td>
</tr>
</tbody>
</table>

Content Item Descriptions

Row 1 Usually the same value as the Clinical Trial Time Point ID (0012,0050) attribute in the Clinical Trial Study Module, though not confined to clinical trial use. May or may not be human readable, and not required to be a DICOM UID.

Row 2 All of the subjects within a treatment protocol that are examined at a particular scheduled time point (e.g., "baseline", "pre-treatment", "first post-treatment") will have the same Protocol Time Point Identifier, but different Subject Time Point Identifiers. However, in different protocols, the Protocol Time Point Identifiers for the same conceptual "time point" will be different. E.g., the "baseline" time point will have different Protocol Time Point Identifiers in different protocols. May or may not be human readable, and not required to be a DICOM UID.

Row 3 Typically a short pre-defined label that has the same scope as Protocol Time Point Identifier (i.e., same conceptual time point within a treatment protocol) but is human-readable and understandable, e.g., "BASELINE" or "TP0", "TP1", etc. Usually the same value as Clinical Trial Time Point Description (0012,0051) attribute in the Clinical Trial Study Module, though not confined to clinical trial use. The Concept Name is selected as (C2348792, UMLS, "Time Point") (which is (C68568, NCIt, "Time Point"), defined as "a specific point in the time continuum, including those established relative to an event") in order to be compatible with external terminologies.

Row 4 More than one type is permitted, e.g., a time point may be "posttreatment" as well as "unscheduled" or "nadir", etc.
The order is expected to be monotonically increasing within a particular scope of usage, but is not required to start at 0 or 1, nor required to increase in increments of 1 or even the same increment (e.g., to allow for retrospective insertion of unscheduled time points). In clinical usage, the Time Point Order would be expected to be temporally increasing, but in a clinical trial may be a randomized reading order rather than a temporal order.

Longitudinal temporal information may be inherited from Longitudinal Temporal Offset from Event (0012,0052) and Longitudinal Temporal Event Type (0012,0053) in the PS3.3 Section C.7.2.3 Clinical Trial Study Module, or may be specified or overridden within this template (e.g., if different measurements in the same SR Instance were measured on different time points).

TID 1600 Image Library

The Image Library contains references to images and selected attributes describing them that facilitate analysis without having to retrieve the entire set of referenced images.

Content Item Descriptions

Horizontal Imager Pixel Spacing

The second component of Pixel Spacing (0028,0030) in the Image IOD. See Section 10.7.1.1 "Pixel Spacing" in PS3.3 and Section C.7.6.2 "Image Plane Module" in PS3.3.

Vertical Imager Pixel Spacing

The first component of Pixel Spacing (0028,0030) in the Image IOD. See Section 10.7.1.1 "Pixel Spacing" in PS3.3 and Section C.7.6.2 "Image Plane Module" in PS3.3.

TID 1605 Image Library Entry Descriptors for CT

This Template contains selected attributes for a CT image or group of such images. The descriptive information may be copied from images or derived.

**Type:** Extensible  
**Order:** Non-Significant  
**Root:** No

**Content Item Descriptions**

Row 3  | Half-life of radiopharmaceutical | The units for half life are chosen to be seconds, to match the units used for Radionuclide Half Life (0018,1075). See Section C.8.9.2 “PET Isotope Module” in PS3.3.  
Row 14 | Glucose Measurement Date | In an earlier edition of the standard, an incorrect DCM code was used for this concept, which was already assigned as (109081, DCM, "Prospective gating").  
Row 15 | Glucose Measurement Time | In an earlier edition of the standard, an incorrect DCM code was used for this concept, which was already assigned as (109082, DCM, "Retrospective gating").

**TID 2000 Basic Diagnostic Imaging Report**

Basic report Template for general diagnostic imaging interpretation reports.

Can only be instantiated at the root node and cannot be included in other Templates.

No Content Items other than those defined in Observation Context TID 1001 “Observation Context” may be the target of a HAS OBS CONTEXT relationship when TID 2000 “Basic Diagnostic Imaging Report” is invoked.

Content Item Descriptions

Rows 2, 3, 4  The content of rows 2, 3, and 4 shall not be inconsistent with the meaning of the report title of row 1. If the report title does not include the concepts of the procedure type, modality, or target site (e.g., the generic "Diagnostic Imaging Report"), these rows may provide post-coordination of those concepts. If the report title does include such concepts (e.g., "CT Head Report"), they may be encoded duplicatively to support report categorization and search.

TID 2001 Basic Diagnostic Imaging Report Observations

Individual numeric or image observations that may be useful for inclusion as individual findings or as the source of inferences in a report.

Type: Non-Extensible
Order: Significant
Root: No

TID 2005 Transcribed Diagnostic Imaging Report

Basic report Template for general diagnostic imaging interpretation reports produced in a dictation/transcription workflow. SR documents encoded using this Template are intended to be transformable to HL7 Clinical Document Architecture format (see Section X.3 “Transcribed Diagnostic Imaging CDA Instance Content” in PS3.17 and Annexes in PS3.20).

This Template can be instantiated only at the root node, and cannot be included in other Templates.
Observation Context shall be inherited from outside the SR Content tree, and shall not be changed within the Content tree. To satisfy the requirement that Observer Context is inherited, either or both the Author Observer Sequence (0040,A078) or the Verifying Observer Sequence (0040,A073) from the SR Document Module must be present in the SOP Instance.

Note

See Section C.17.5 “Observation Context Encoding” in PS3.3.

**Content Item Descriptions**

Rows 2, 3, 4 shall not be inconsistent with the meaning of the report title of row 1. If the report title does not include the concepts of the procedure type, modality, or target site (e.g., the generic "Diagnostic Imaging Report"), these rows may provide post-coordination of those concepts. If the report title does include such concepts (e.g., "CT Head Report"), they may be encoded duplicatively to support report categorization and search.

Row 6 CONTAINER Concept Name may be absent.

Row 10 IMAGE Concept Name shall be absent.

**TID 2006 Imaging Report With Conditional Radiation Exposure and Protection Information**

This Template is used for general imaging reports for both radiation producing and non-radiation producing modalities.

For radiation producing modalities, radiation exposure and protection information is required, such as to support nationally-specific legal or standard requirements.

It contains mandatory sections, each of which may appear only once in objects instantiated from the Template, including the medical content of the report that comprises relevant medical history data, information on the current request (i.e., clinical question that is
expected to be answered by the requested procedure), impressions on the current imaging procedure that has been performed, and radiation exposure and protection information.

This Template is a specialization of TID 2000 “Basic Diagnostic Imaging Report”, in that it uses the same structure of headings and content, but mandates the presence and order of specific headings, and extends the subordinate content with specific Content Items.

Type: Non-Extensible  
Order: Non-Significant  
Root: Yes

Content Item Descriptions

Row 2  Even though this information is related to the content of Row 6 in TID 2007 “Imaging Procedure Description”, it is present here for consistency with other report Templates.

Rows 5, 6  Information on at least one of the following person observers is mandatory:

1) "Performing Physician"
2) "Performing Technologist".

(For those person observers, requirement types as specified in TID 1003 “Person Observer Identifying Attributes” apply. That means that "Person Observer Name" is the only mandatory attribute).

Row 20  Each heading (concept code from CID 7001 “Diagnostic Imaging Report Headings”) may appear only once, and may not repeat the headings (concept codes) used when instantiating any other rows of this Template.

TID 2007 Imaging Procedure Description

Contains information related to the procedure.

Type: Extensible
Order: Non-Significant
Root: No
TID 2008 Radiation Exposure and Protection Information

Contains information related to the radiation exposure and protection of the patient, as is required by national legal requirements or standards.

Other information about the current procedure is described in TID 2006 “Imaging Report With Conditional Radiation Exposure and Protection Information” and not repeated here.

Type: Extensible
Order: Non-Significant
Root: No

### Content Item Descriptions

<table>
<thead>
<tr>
<th>Row 5</th>
<th>The clinician responsible for determining that the irradiating procedure was appropriate for the indications.</th>
</tr>
</thead>
</table>
| Row 6 | A textual, human-readable description of the radiation exposure is all that is required by this Template (such as is sufficient to comply with, for example, German law). Detailed specification of exposure is out of the scope of this Template. Such information may be given in a separate SR instances such as described in TID 10001 “Projection X-Ray Radiation Dose” or TID 10011 “CT Radiation Dose”, and referenced from TID 2007 “Imaging Procedure Description”.

### TID 2010 Key Object Selection

The Key Object Selection Template is intended for flagging one or more significant images, waveforms, or other composite SOP Instances. Key Object Selection contains:

- coded document title stating the reason for significance of the referenced objects in the Key Object Selection,
- optional free form text comment in an explicitly identified language, and
- optional identification of the observer (device or person) that created the Key Object Selection.

**Note**

1. For instance, when this Template is used to identify images rejected for quality reasons, the device or person performing the quality assessment is identified in observation context items (invoked through TID 1002 "Observer Context"). The reason for rejection can be included both as a code used as a concept modifier for the document title, and as text description.

2. The order of object references may be significant, e.g., when the title concept is "For Conference".

3. Instances referenced in a Key Object Selection Document may be securely referenced by Digital Signature or MAC mechanisms within the SR Document General Module (see PS3.3).

The Template can only be instantiated at the root node and cannot be included in other Templates. The Template is not extensible; that is, no other Content Items may be added to this Template, or the Templates that are included, recursively.

**Type:** Non-Extensible  
**Order:** Non-Significant  
**Root:** Yes

**TID 2020 Spectacle Prescription Report**

The Spectacle Prescription Report is a structured report used to represent the prescription for a patient. Usually a prescription is for both eyes, but sometimes just one. The Spectacle Prescription Report defines a refractive correction relative to which visual acuity may be measured subjectively, and thus may be referenced by a Visual Acuity Measurements Storage SOP Instance.

The Macular Grid Thickness and Volume Report is a structured report encoding the macular grid thickness and volume values derived from ophthalmic images, such as ophthalmic OPT images. This may encode measurements of either or both eyes.

The macular grid conveyed by this report is based upon the grid employed by the Early Treatment of Diabetic Retinopathy Study (ETDRS) to measure area and proximity of macular edema to the anatomic center (fovea) of the macula. See ETDRS Report Number 10.

TID 2102 Quality Rating Identification

This Template specifies the algorithm (and parameters) used to create a quality rating for an image or image set.

It is expected that the identified algorithm will create a consistent quality rating when analyzing a given image. If the algorithm allows change to its parameters that would alter the quality rating created, the specific parameters used should be specified.

Type: Non-Extensible
Order: Significant
Root: No

Procedure Log IOD Templates

TID 3001 Procedure Log

The Procedure Log Template is intended for the representation of reports or logs of time-stamped events occurring during an image-guided interventional or other procedure.

This Template does not require a particular ordering of the subsidiary Content Items.

Note

1. The Procedure Log IOD (PS3.3) requires ordering by Observation DateTime; thus log entries of different types (i.e., specified by different Rows in the Template) may appear in any order.

2. While this Template is extensible, the Procedure Log IOD forbids Container Content Items subsidiary to the top level Container.

Type: Extensible
Order: Non-Significant
Root: Yes

**Content Item Descriptions**

Row 2  Includes TID 1002 “Observer Context”, which shall be used to record the identity of the person responsible for recording the log, as well as all other participants in the procedure, even though these personnel may not technically be "observers" of the Procedure Log. As participants in the procedure, they are potential sources for events and observations recorded in the Log. TID 1002 “Observer Context” allows the specification of the person's role in the organization (e.g., physician, nurse), as well as the role in the procedure (e.g., circulating, performing, etc.).

Row 5  Shall be used to record the identity of the major equipment used in the procedure.

Row 6  May be used to record any event not covered by a specific log entry Template.

**TID 3010 Log Entry Qualifiers**

The Log Entry Qualifiers Template provides a common means for adding additional description to a procedure log Content Item. It allows identification of a source for the procedure log entry (other than the recording observer for the log as a whole), a free text comment, a link to a particular Procedure Action item, a link to a particular lesion, or the date/time of recording (if different than the time of the event occurrence recorded in the Observation DateTime of the parent Content Item).

**Content Item Descriptions**
Procedure Action ID allows linking recorded events to a particular action, step, or phase of a procedure. See description for TID 3100 “Procedure Action”.

Lesion Identifier is specified as a numeric text string, and allows linking recorded events to the diagnosis or therapy of particular lesion. See description for TID 3105 “Lesion Identification and Properties”.

### TID 3100 Procedure Action

The Procedure Action Template is intended for the recording of the beginning or end of procedure steps or action items in a procedure. The level of granularity of the recorded events is not specified, and may vary between institutions, or even be at multiple levels within a single procedure log. There is no requirement for the real-world procedure step or action item recorded with this Template to end before another one begins; there may be overlapping or simultaneous procedure steps or action items.

This log entry Template may be used to record the start or stop of timers.

Other recorded events in the procedure may be linked to a particular step or action item by Procedure Action ID (see TID 3010 “Log Entry Qualifiers”).

**Type:** Extensible  
**Order:** Significant  
**Root:** No

#### Content Item Descriptions

**Row 2**  
The value of the Procedure Action ID shall be uniquely associated with the step or action within the context of the Study, and may be used to associate various Procedure Log entries with the step or action.

**Row 3**  
May be used to record the identity of staff roles for the purpose of this Procedure Action, which may differ from their roles in the procedure as a whole.

**TID 3104 Consumables**

The Consumables Template allows recording of devices (e.g., catheters or stents), drugs, or contrast agents accessed in a procedure. This Content Item is directed towards inventory control and billing. The actual clinical use of the particular consumable is recorded using TID 3106 “Drugs/Contrast Administered” or TID 3107 “Device Used”.

This Template allows recording both consumable retrieval from, and return to, inventory or stock, and disposal of used material. The quantity involved in each recorded transaction may be specified.

TID 3105 Lesion Identification and Properties

The Lesion Identification and Properties Template allows recording the identification of each lesion addressed in a procedure. The lesion identifier may be used to relate diagnostic or therapeutic actions with their target lesion (see Row 4 in TID 3010 “Log Entry Qualifiers”). This Content Item may include the initial visually estimated measurements of stenosis or TIMI flow; measured values from a quantitative measurement report may be referenced indirectly (through TID 3103 “Referenced Object”), or by quotation (TID 3109 “Measurements”). Subsequent (e.g., post-intervention) stenosis measurements may be encoded using TID 3109 “Measurements”, with the Lesion Identifier conveyed through its subsidiary TID 3010 “Log Entry Qualifiers” Template.

Content Item Descriptions

- Standard -
Lesion Identifier is specified as a numeric text string in order to facilitate transcoding to DICOM Attribute (0018,3105) Lesion Number and to formats for outcomes registries, such as the ACC National Cardiovascular Data Registry™.

**TID 3106 Drugs/Contrast Administered**

The Drugs/Contrast Administered Template allows the recording of the start or end of that type of event, together with its parameters. If start and end are represented by a single log entry (e.g., for an injection), the concept name "Drug/contrast administered" shall be used.

**TID 3107 Device Used**

The Device Used Template allows recording of the use of interventional diagnostic and therapeutic devices.

The identification of one device used to deploy another device (e.g., a balloon catheter to deploy a stent) may be described with two entries, with one identified as a deployment device in the Concept Modifier of Row 6 of this Template, and linked by the same Procedure Action ID in the Log Entry Qualifiers of the included TID 3010 “Log Entry Qualifiers”.

Content Item Descriptions

Row 4  Intervention attempt Identifier is specified as a numeric text string, and shall be treated as the ordinal of the recorded attempted intervention within this procedure (i.e., "1" for the first attempted intervention, "2" for the second, etc.).

TID 3109 Measurements

The Measurements Template allows recording of significant measurements, such as vital signs, laboratory results, hemodynamic measurements, or quantitative analysis measurements. These measurements are often quoted from another source, which would be documented in the included TID 3010 “Log Entry Qualifiers”.

| Type: Extensible | Order: Significant | Root: No |

TID 3110 Impressions or Findings

The Impressions or Findings Template allows the recording of unconfirmed (provisional) impressions or findings noted during the procedure. It is not intended to convey the Cath Lab Clinical Report (the formal report from the performing physician), although it may be used (like any Procedure Log entry) for the subsequent construction of the Cath Lab Clinical Report.

A finding that is supported by a specific image frame may reference that image in the INFERRRED FROM / IMAGE row of the included TID 3010 “Log Entry Qualifiers” Template.

| Type: Extensible | Order: Significant | Root: No |

**TID 3112 Specimen Obtained**

The Specimen Obtained Template allows recording of obtaining a specimen, and the identifiers for that specimen. This is particularly designed for blood samples that will be analyzed for blood oxygen-related measurements. The analysis of the sample may be recorded in one or more log entries using TID 3109 “Measurements”, or in a separate Structured Report SOP Instance referenced by a log entry using TID 3103 “Referenced Object”.

Content Item Descriptions

Row 8
Pulse Strength allows the assessment of the patient’s pulse at multiple locations using the Topographical concept modifier. It may also be used for a single pulse strength measurement from an unspecified location, as is typical of vital signs assessments.

Row 16
Allows free text description of patient assessments that are not expressible by coded entries of Rows 10 to 14.

TID 3115 ECG ST Assessment

The ECG ST Assessment Template allows recording of the assessment of changes in the patient ECG relative to baseline.

Type: Extensible
Order: Significant
Root: No

### Content Item Descriptions

**Row 3**: Identifies the Calibration program

---

- Standard -
Identifies the Calibration program version

Identifies the Calibration program manufacturer

Besides a Sphere and a Catheter, a Distance can be identified as a Calibration Object. In this case a distance measurement of a known dimension of the object is used to calculate the pixel size.

The catheter size units is also used to specify the size of other calibration objects (e.g., sphere)

Spacing in the patient body. Point to a single frame containing the image used for calibration if applicable, the actual measurements may be indicated by a SCOORD (see TID 320 "Image or Spatial Coordinates", row 3)

Secondary Capture image with calibration position

**TID 3206 VA Main Results**

The VA Main Results Template consists of a CONTAINER with a structure for reporting the main ventricular analysis measurements.

### Content Item Descriptions

**Row 4**
Normalized lengths of the chords determined between ED and ES contour. The measurement Template allows the specification of the statistical properties of the normal population and of the chord measurement relative to the population.

**Row 8**
If the Circumferential Extent is not specified no limitations to the boundaries for regions are assumed.

**Row 11**
The Regional Abnormal Wall Motion container holds the information on the severity of the decreased or increased wall motion of the 4 predefined regions as described in [Sheehan, 1986].

**Row 12**
The name of the region with an abnormal ventricular wall motion as described in [Sheehan, 1986].

**Row 13**
The severity of the wall motion abnormality expressed in Standard Deviations above or below normal in the territory region as described in [Sheehan, 1986].

**Row 14**
The severity of the wall motion abnormality expressed in Standard Deviations above or below normal in the opposite region as described in [Sheehan, 1986].

**Row 15**
Secondary Capture image with centerline analysis result

**Content Item Descriptions**

Row 1 | Observation DateTime (0040,A032) of container needs to be flagged with the time of the analysis
Numeric coordinates (x,y) identifying the contour points from proximal to distal of left contour. Left is relative to the direction of the blood flow.

Numeric coordinates (x,y) identifying the contour points from proximal to distal of right contour. Right is relative to the direction of the blood flow.

Positions are relative to the midpoint between the first left and right contour points and measured along the midline between the left and right contour.

The X-axis represents the pixel points of the midline of the vessel from proximal to distal. The points on the midline are not necessarily equidistant.

For each point of the midline of the vessel a measurement value for the diameter is calculated.

The positions in the graph are related to the points on the midline of the vessel.

Secondary Capture image with Arterial Analysis contour.

Definition of Left and Right defined by the direction of the blood flow as in Figure A-4b:

![Figure A-4b. Direction of Blood Flow](image)

Content Item Descriptions

| Row 8 | Set of user defined reference position for method that requires local reference position. |
| Row 9 | Distance of local reference position from an arbitrary landmark. |
| Row 10 | Diameter at a local reference position. |
The reference diameter for the arterial lesion calculated with the applicable reference method

The reference area for the arterial lesion calculated with the applicable reference method

The diameter measurement at the start of the reconstruction line in the diameter graph (TID 3214 "Analyzed Segment" Row 14)

The diameter measurement at the end of the reconstruction line in the diameter graph (TID 3214 "Analyzed Segment" Row 14)

The positions of the lesion, borders of the lesion, etc.

The graph with the calculated cross sectional area results based on the densitometric method

The cross sectional area measurements calculated based on the densitometric method

The cross sectional area measurement at the start of the reconstruction line in the area graph

The cross sectional area measurement at the end of the reconstruction line in the area graph

Measured along the midline of the left and right contour

The diameter stenosis is calculated as follows:

\[
\text{Diameter Stenosis} = \frac{\text{Reference Luminal Diameter} - \text{Minimum Luminal Diameter}}{\text{Reference Luminal Diameter}} \times 100\%
\]

The circular and the densitometric area stenosis are calculated respectively as:

\[
\text{Circular Stenosis} = \frac{\text{Reference Vessel Lumen Cross-Sectional Area} - \text{Minimum Luminal Circular Area}}{\text{Reference Vessel Lumen Cross-Sectional Area}} \times 100\%
\]

\[
\text{Densitometric Stenosis} = \frac{\text{Reference Vessel Lumen Cross-Sectional Area} - \text{Minimum Luminal Densitometric Area}}{\text{Reference Vessel Lumen Cross-Sectional Area}} \times 100\%
\]

Estimated lumen volume between proximal border and distal border of lesion (TID 3218 "Position in Arterial Segment", row 1 and 2)

Secondary Capture image with obstruction analysis contour

**TID 3216 Stenotic Flow Reserve**

The Stenotic Flow Reserve Template consists of a CONTAINER providing quantitative arterial analysis measurements derived for an obstruction in a total analyzed segment.

TID 3252 IVUS Lesion

The IVUS Lesion Template provides a structure for grouping measurements and observations made on a single lesion during an Intravascular Ultrasound Procedure.

Type: Extensible
Order: Significant
Root: No

**Content Item Descriptions**

**Row 2**

Lesion Identifier is specified as a numeric text string in order to facilitate trans-coding to DICOM Attribute (0018,3105) Lesion Number and to formats for outcomes registries, such as the ACC National Cardiovascular Data Registry™.

Note

Also see TID 3105 “Lesion Identification and Properties”.

**Row 3**

Finding site may span multiple segments with the proximal and distal extent specified by separate items. These may not be totally contained with the segment specified at the Vessel level.

**TID 3253 IVUS Measurements**

The IVUS measurements Template groups together simple distance, area and angle measurements, along with derived measurements that made during an IVUS procedure. Refer to the "ACC Clinical Expert Consensus Document on Standards for Acquisition, measurement and Reporting of Intravascular Ultrasound Studies (IVUS) " for more information.

Content Item Descriptions

Row 12: Image Type may be copied from the NM Image SOP Instance attribute Image Type (0008,0008) value 3, or from the PET Image SOP Instance attribute Series Type (0054,1000).
The Procedure Time Base is the time from which elapsed times are measured. The Study Time (0008,0030) may include the patient prep period, while this Procedure Time Base is typically established when baseline data collection begins.

**TID 3303 Stress Test Phase Data**

The Stress Test Phase Data Template provides a structure for measurements acquired during a single procedure phase.

**Content Item Descriptions**

Row 1

The Container shall have a specific Content Item Observation DateTime (0040,A032) attribute to indicate the time at which the phase began.

**TID 3304 Stress Test Measurement Group**

Each instance of the Stress Test Measurement Group represents a group of data elements acquired at approximately the same instant, and conventionally rendered as row in a tabular presentation. It is typically generated during the Stress exam whenever a time interval elapses (for example, every minute of the phase), when a technician observes data worth capturing, or when measurements exceed a given range.

**Type:** Extensible

**Content Item Descriptions**

Row 1  The Container shall have a specific Content Item Observation DateTime (0040,A032) attribute to indicate the time at which the measurements were made.

Row 10 Included TID 3106 “Drugs/Contrast Administered” allows the recording of test medications other than the Pharmacological Stress Agent identified in TID 3301 “Stress Test Procedure Description”.

Rows 17, 18 ECG ST elevation/depression is measured in units of mV, but is conventionally reported in units of mm, based on strip recordings with scaling of 100 uV/mm. The display application should render these measurements in units meaningful to the user.

Row 19 Note that the MDC codes for ”per lead” measurements specified in CID 3228 “ECG Timing Measurements” are base codes for post-coordination with lead identifiers conveyed in the Target Site modifier in TID 300 “Measurement”. MDC also defines pre-coordinated codes that include both the measurement and the lead, which may be used in this row.

Row 20 Note that the MDC code for ”QTc interval per lead” specified in CID 3227 “QTc Measurements” is a base code for post-coordination with lead identifiers conveyed in the Target Site modifier in TID 300 “Measurement”. MDC also defines pre-coordinated codes that include both the measurement and the lead, which may be used in this row.

Note that TID 300 “Measurement” enables the encoding of a non-standard correction algorithm, either as a local code, or as a TEXT Method Citation (see TID 300 “Measurement” row 12).

Row 21 R-R interval used for QT correction algorithm

Row 22 Recommended range for ECG axis measurements is -90° to +270°

Content Item Descriptions

These invocations of TID 5203 "Echo Measurement" do not include an inherited Findings Site concept, for example as in the invocations of TID 5203 "Echo Measurement" from TID 5202 "Echo Section". Echo measurements that do not have the associated Finding Site pre-coordinated in the measurement concept (i.e., the orifice flow measurements of CID 12222 "Orifice Flow Properties"), shall have the Finding Site explicitly post-coordinated with a Concept Modifier (Rows 4, 6, 8, and 10).

This Template does not include the concept of an Image Library, for example as used in TID 5200 "Echocardiography Procedure Report". Image Content Items in the Echo Measurement Template shall be included with by-value relationships, not with by-reference relationships.

Content Item Descriptions

Each observation (measurement or finding) may have a specific Content Item Observation DateTime attribute to indicate the time in the procedure at which the observation was made (e.g., time of maximum heart rate, or time of occurrence of an arrhythmia).

This Concept and the associated Concept Modifier may be instantiated twice, once for resting state measurements, once for stress.

DICOM PS3.16 2018c - Content Mapping Resource
### Content Item Descriptions

**Row 4**
This row may be instantiated twice, once for resting state measurements, once for stress.

**Row 15**
The LVEF code specified in this row is defined in LOINC with method "imaging". LVEF measurement by ultrasound may also be encoded elsewhere in the Content Tree (e.g., in TID 3309 “Stress Echo Measurement Group”) with LOINC code 18043-0, which has method "ultrasound". It is recommended that such findings from the per-phase measurements be summarized here with the generic "LVEF by Imaging" concept code.

### TID 3318 Comparison to Prior Stress Exam

This Template describes changes in findings from a prior stress exam. Comparison is to only one prior exam, even though the generic concept name for the Template uses the plural "exams".

| Type: Extensible | Order: Significant | Root: No |

### Table TID 3318. Comparison to Prior Stress Exam

### Hemodynamics Report Templates

The Templates that comprise the Hemodynamic Report are interconnected as shown in Figure A-6.
**Figure A-6. Hemodynamic Report Template Hierarchy**

Figure A-6 shows only the use of Templates specific to the Hemodynamic Report; it does not show common structural Templates such as TID 300 "Measurement".

Note

Figure A-6 shows the relationship of Templates; it does not show the structural hierarchy of Content Items in the IOD. See Figure L-1 "Hemodynamics Report Structure" in PS3.17.

**TID 3500 Hemodynamics Report**

The Hemodynamic Report Template is the root structure for the representation of measurements acquired during a procedure in a cardiac catheterization lab.

#### Content Item Descriptions

- Standard -
Procedure Action ID allows linkage between the hemodynamic measurements recorded in this Template and a procedure step or phase recorded in the Procedure Log, e.g., using TID 3100 “Procedure Action”.

**TID 3504 Arterial Pressure Measurement**

The Arterial Pressure Measurement Template consists of a CONTAINER, with an acquisition context of the measurement anatomic site, and containing systolic, diastolic, and mean measurements. This implies that the name of the measurement is effectively post-coordinated from the measurement name, the Hemodynamic Measurement Group container (procedure phase) name, and the acquisition context (finding site) value.

**Type:** Extensible  
**Order:** Significant  
**Root:** No

</tbody>
</table>

**TID 3505 Atrial Pressure Measurement**

The Atrial Pressure Measurement Template consists of a CONTAINER, with an acquisition context of the measurement anatomic site, and containing a-wave, v-wave, and mean measurements. This implies that the name of the measurement is effectively post-coordinated from the measurement name, the Hemodynamic Measurement Group container (procedure phase) name, and the acquisition context (finding site) value.

**Type:** Extensible  
**Order:** Significant  
**Root:** No

### TID 3508 Gradient Measurement

The Gradient Measurement Template consists of a CONTAINER, with an acquisition context of the measurement anatomic site, and containing the gradient measurement. This implies that the name of the measurement is effectively post-coordinated from the measurement name, the Hemodynamic Measurement Group container (procedure phase) name, and the acquisition context (finding site) value.

**Type:** Extensible  
**Order:** Significant  
**Root:** No

**Content Item Descriptions**

Row 5

Is used to encode the gradient measurements. Uses TID 300 “Measurement” for the Content Item structure of the measurements. That Template allows an INFERRED FROM relationship to other numeric measurements used in the computation or derivation of the current measurement. In the case of a gradient measurement, the pressure measurements at the distal and proximal locations may thus be explicitly conveyed.

**TID 3509 Blood Velocity Measurement**

The Blood Velocity Measurement Template consists of a CONTAINER, with an acquisition context of the measurement anatomic site, and containing primary (not derived) velocity measurements, e.g., from a Doppler catheter. Derived velocity measurements may be recorded using TID 3560 “Derived Hemodynamic Measurements”.

TID 3516 Blood Lab Measurements

The Blood Lab Measurements Template provides for the recording of measurements made on blood samples obtained during a catheterization procedure. The type and anatomic source of the blood is recorded as acquisition context. The results from the blood chemistry measurement system are quoted; the measurement names may be pre-coordinated with the type or source of the blood,
or generic measurement names may be reported. In the latter case, the full measurement concept name may be effectively post-co-ordinated using the recorded acquisition context.

**TID 3520 Hemodynamic Clinical Context**

The Clinical Context Template allows the recording of information about the patient's clinical state that may affect interpretation of the hemodynamic measurements. This Template includes several coded conditions (e.g., complications, drugs, physiological challenges, etc.), each of which may have a Concept Modifier of "Relative Time". This Modifier indicates the temporal relationship of the hemodynamic measurements to the conditions recorded in this Template. E.g., the Content Item structure:
[CONTAINER] "Findings"

> HAS ACQ CONTEXT "Cath Procedure Phase" "Post-intervention phase"

> HAS ACQ CONTEXT [CONTAINER] "Clinical Context"

>> CONTAINS [CODE] "Complication" "Arrhythmia"

>>> HAS CONCEPT MOD [CODE] "Relative Time" "After"

> CONTAINS [CONTAINER] "Arterial Measurements" …

conveys the semantics that this group of measurements for the post-intervention phase of a cath procedure was made after an occurrence of arrhythmia in the patient.

In the absence of a Relative Time modifier, the acquisition context is during the identified event or state.

TID 3602 Cardiovascular Patient Characteristics

This Template describes the characteristics of the patient that are specific to the current clinical presentation (visit). Patient Characteristic concepts in this Template, which may replicate attributes in the Patient Study Module, are included here as possible targets of by-reference relationships from other Content Items in the SR tree.

Note

Several of the concepts in this Template duplicate concepts in TID 1007 “Subject Context, Patient”. The difference in use is that this Template has those concepts as primary observations of the patient, while in TID 1007 “Subject Context, Patient” the concepts are used to set (or reset) the context for other observations.

Type: Extensible
Order: Significant
Root: No

TID 3713 ECG Global Measurements

The ECG Global Measurements Template provides a structure for measurements calculated across the ECG waveform as a whole (multiple leads).

As an Extensible Template, applications may include any ECG global measurements, such as angles of the electrical vector of various ECG waves. The recommended vocabulary for such concepts is ISO/IEEE 11073-10102.

- Standard -
TID 3715 ECG Measurement Source

The ECG Measurement Source Template provides a structure for identifying the particular cardiac cycle, or beat, in an analyzed ECG waveform used for the measurement group for which this Template provides Observation Context. The cardiac cycle is identified by beat number, and optionally by specific temporal coordinates within a DICOM ECG Waveform SOP Instance.

**Type:** Extensible  
**Order:** Significant  
**Root:** No

### Table TID 3715. ECG Measurement Source

</tbody>
</table>

#### Content Item Descriptions

**Row 1:** Beat Number is specified as a numeric text string, and shall be treated as the ordinal of the beat (cardiac cycle) within the waveform acquisition for this lead that was analyzed for the measurements in this container (i.e., “1” for the first beat, “2” for the second, etc.). If absent, the measurements may have been made by a technique across multiple cycles as specified in Row 2 Measurement Method.

**Rows 3 and 4:** Source of measurement identify the specific channel and time period within a DICOM ECG Waveform SOP Instance that was analyzed for the measurements in this container.

TID 3717 ECG Qualitative Analysis

The ECG Qualitative Analysis Template allows a free text qualitative interpretation of the analyzed ECG, as well as a structure for a coded analysis.

**Type:** Extensible  
**Order:** Significant  
**Root:** No

**Content Item Descriptions**

Row 3-4: ECG Finding provides one or more coded interpretive statements using standard or implementation-specific codes. Each coded finding will include a Code Meaning (0008,0104) using the LO Value Representation (64 characters); longer human-readable text strings for interpretive statements may be conveyed in the Row 4 Equivalent Meaning of Value Content Item.

Row 5-6: Each primary ECG Finding of Row 3 may have multiple supporting coded findings in Row 5, with longer human-readable text strings for interpretive statements if necessary in Row 6.

### TID 3718 ECG Interpretive Statement (Retired)

This Template is retired. See PS3.16-2009.

Cath Lab Clinical Report Templates

The Templates that comprise the Cardiac Catheterization Report are interconnected as shown in Figure A-7.

![Figure A-7. Cardiac Catheterization Report Template Hierarchy](image)

**Note**

Figure A-7 shows the relationship of Templates; it does not show the structural hierarchy of Content Items in the IOD.

**TID 3800 Cardiac Catheterization Report Root**

The Cardiac Cath Report provides the overall clinical results of the catheterization procedure and interventions. In many cases, more detailed information is optionally available in other reports (Hemodynamic Measurements, Procedure Log, etc.). That information is collected and summarized here (and referenced when available).

When a Discharge Summary section (row 12) is included, this report Template covers the full set of information required for submission to the ACC NCDR™ (version 2.0) registry.

**Note**

1. The information required for such a submission must sometimes be reformatted from a single concept in these Templates to two data elements for the registry, or vice versa.

2. This Template is expected to be used with the Basic Text SR or Enhanced SR IOD.3. This Cardiac Cath Report Template is a baseline Template within these SOP Classes that may be replaced; it is therefore in no sense binding for exchange of this type of report. It is solely an example of a possible encoding of the Cardiac Cath Report.

TID 3802 Cardiovascular Patient History

This Template contains information about a cardiovascular patient's past medical history that is relevant for the interpretation of the SR document of which it is part. This information is considered to have some degree of "persistence" across different episodes of care.

Type: Extensible  
Order: Significant  
Root: No

### Content Item Descriptions

Row 4
(Through TID 3819 “Common Findings”) may be used to encode any significant hemodynamic numeric measurements. For reference, see TID 3550 “Pressure Waveform Measurements” and TID 3560 “Derived Hemodynamic Measurements”.

### TID 3814 Left Ventriculography Findings

The information contained here about the left ventricle is relatively qualitative in nature. It is a high-level summary of the more detailed information that may be contained in an optional Quantitative Ventricular Analysis report. This Template addresses findings about any ventricular septal defect (Row 7), the myocardial wall (Row 11), and about the aortic root (Row 16).

### TID 3817 Coronary Arteriography Findings

The information contained here about with regards to coronary artery lesions is relatively qualitative in nature. It is a high-level summary of the more detailed information that may be contained in an optional Quantitative Coronary Arteriography report. This Template addresses findings about the individual arteries (Row 4), and about individual lesions (Row 9).

TID 3906 Vascular Section Measurements

Sections of vascular measurements are section containers of an anatomical region consisting of measurement group containers containing the measurements.

Table TID 3906. Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Parameter Usage</th>

**Content Item Descriptions**

**Row 3**
This Findings container allows an application to group related vessels or branches

**Row 5**
The characteristics associated with the parent vessel shall also be reported in the findings Container for the parent vessel. Negative findings (characteristics not present) need not be reported in the parent vessel Container.

**TID 3907 Vessel Measurements**

Contains measurements made on vessel level.

**Type:** Extensible

**Order:** Significant

**Root:** No

Content Item Descriptions

Rows 3-5  The distance between two identified fiducial features
Rows 7-10 Measurement of vessel diameter made at a position relative to a fiducial feature
Row 9  A positive value indicates a distance in the direction of flow within the vessel

TID 3908 Vascular Lesion

Specifies properties and the features of a vascular lesion detected during the analysis. In addition it is possible to reference or include growing of lesions over time by adding references to previous reports or by adding previous examination results.

**Content Item Descriptions**

**Row 5**

A positive value indicates a distance in the direction of flow within the vessel.

For example: An aneurysm with relative position -4 mm from the renal arteries would begin superior to the renal arteries.
These rows are associated with the position of the most significant effect of the lesion, i.e., maximum diameter of aneurysm or the minimum diameter of stenosis.

**TID 3909 Best Illustration of Findings**

Specification of images, waveforms, spatial and temporal coordinates used to illustrate findings.

### Mammography CAD SR IOD Templates

The Templates that comprise the Mammography CAD SR IOD are interconnected as in Figure A-8:
In Figure A-8, ‘···’ indicates possible recursive application of subordinate Templates.

**TID 4000 Mammography CAD Document Root**

This Template forms the top of a content tree that allows a mammography CAD device to describe the results of detection and analysis of mammographic evidence. This Template, together with its subordinate Templates, describes both the results for presentation to radiologists and partial product results for consumption by mammography CAD devices in subsequent mammography CAD reports.

This Template defines a Container that contains an Image Library, the mammography CAD results, and summaries of the detection and analysis algorithms performed. The Image Library contains the Image SOP Class and Instance UIDs, and selected attributes for each image referenced in either the algorithm summaries or mammography CAD results.

The Summary of Detections and Summary of Analyses sub-trees gather lists of algorithms attempted, grouped by success/failure status. Algorithms not attempted are not mentioned in these sub-trees. This information forms the basis for understanding why a mammography CAD report may produce no (or fewer than anticipated) results. Mammography CAD results are constructed bottom-up, starting from Single Image Findings (see TID 4006 “Mammography CAD Single Image Finding”), associated as Composite Features (see TID 4004 “Mammography CAD Composite Feature”), and from which Individual and Overall Impressions are formed.
See Figure E.1-1 "Top Levels of Mammography CAD SR Content Tree" in PS3.17.

</table>

**Content Item Descriptions**
The "Image Library" section of the Content Tree (TID 4000 "Mammography CAD Document Root", row 3) shall include all Image SOP Instances from the Current Requested Procedure Evidence Sequence (0040,A375) attribute of the SR Document General module. If a portion of another instance of a Mammography CAD SR IOD is duplicated in the "Overall Impression/ Recommendation" section of the Content Tree, the "Image Library" shall also include all Image Library Entries referenced from the duplicated portions of the Mammography CAD SR.

Detections Performed

The "Detections Performed" and "Analyses Performed" sections of the Content Tree (TID 4000 "Mammography CAD Document Root", rows 6 and 8) together shall reference all Image SOP Instances included in the Current Requested Procedure Evidence Sequence (0040,A375) attribute of the SR Document General module.

**TID 4001 Mammography CAD Overall Impression/Recommendation**

This Template forms the top of the mammography CAD results sub-tree. The contents of this Template describe the overall impression the mammography CAD device had for the mammographic evidence presented and any recommendations that the mammography CAD device made. The details of the overall impression and recommendation are expressed in this instance of the Mammography CAD Impression/Recommendation Body (see TID 4002 "Mammography CAD Impression/Recommendation Body"). The data from which the details are inferred, are expressed in the Mammography CAD Individual Impression/Recommendations (see TID 4003 "Mammography CAD Individual Impression/Recommendation"), of which there may be several.

</tbody>
</table>

**Content Item Descriptions**

**CAD Processing and Findings Summary**

This code value is used to express if and why the Overall Impression/Recommendation sub-tree is empty. The Summary of Detections and Summary of Analyses sub-trees of the Document Root node contain detail about which (if any) algorithms succeeded or failed.

If the code value indicates that there were no findings, then the code value can be used to determine whether mammography CAD processing occurred successfully, without parsing the Summary of Detections and Summary of Analyses sub-trees.

**Row 3**

There are no constraints regarding the 1-n multiplicity of the inclusion of TID 4003 "Mammography CAD Individual Impression/Recommendation" or its underlying structure, other than the TID 4001 "Mammography CAD Overall Impression/Recommendation" and TID 4003 "Mammography CAD Individual Impression/Recommendation" requirements. Individual Impression/Recommendation containers may be organized, for example per image, per finding or composite feature, or some combination thereof.
TID 4002 Mammography CAD Impression/Recommendation Body

The details of an impression and recommendation are expressed in this Template. It is applied to both Mammography CAD Overall Impression/Recommendation (TID 4001 “Mammography CAD Overall Impression/Recommendation”) and Mammography CAD Individual Impression/Recommendation (TID 4003 “Mammography CAD Individual Impression/Recommendation”).

**Type:** Non-Extensible  
**Order:** Significant  
**Root:** No

### Content Item Descriptions

- **Certainty of Impression**: The certainty that the device populating the Mammography CAD SR report places on this impression, where 0 equals no certainty and 100 equals certainty.
- **Impression Description**: Free-form text describing the overall or an individual impression.

---

### TID 4003 Mammography CAD Individual Impression/Recommendation

This Template collects an individual impression the mammography CAD device had for a lesion, non-lesion object, or correlation of related objects. The details of the impression and recommendation are expressed in the Mammography CAD Impression/Recommendation Body (see TID 4002 “Mammography CAD Impression/Recommendation Body”). The data from which the details are inferred are expressed in the Composite Features (see TID 4004 “Mammography CAD Composite Feature”) and/or Single Image Findings (see TID 4006 “Mammography CAD Single Image Finding”) of which there may be several.

The sub-tree headed by this Template is illustrated in Figure E.1-3 “Example of Individual Impression/Recommendation Levels of Mammography CAD SR Content Tree” in PS3.17.

Content Item Descriptions

| Rendering Intent | This Content Item constrains the SCP receiving the Mammography CAD SR IOD in its use of the contents of this Template and its Target Content Items. Mammography CAD devices may opt to use data marked "Not for Presentation" or "Presentation Optional" as input to subsequent mammography CAD processing steps. Refer to Section O.2 “Structured Reporting Storage SOP Class SCU and SCP Behavior” in PS3.4. |

TID 4004 Mammography CAD Composite Feature

This Template collects a composite feature for a lesion, non-lesion object, or correlation of related objects. The details of the composition are expressed in the Mammography CAD Composite Feature Body (see TID 4005 “Mammography CAD Composite Feature Body”). The data from which the details are inferred, are expressed in the Composite Features (see TID 4004 “Mammography CAD Composite Feature”) and/or Single Image Findings (see TID 4006 “Mammography CAD Single Image Finding”), of which there may be several.

A Composite Feature shall be INFERRED FROM any combination of two or more Composite Features or Single Image Findings or mixture thereof.

**Content Item Descriptions**

Certainty of Feature
The likelihood that the feature analyzed, and classified by the CODE specified in the Composite Feature parent Template, is in fact that type of feature.

Volume Measurement
If dimensions for a volume are to be stated in terms of length, width, and depth, then one shall use 3 instances of TID 1400 "Linear Measurement".
Values ≤ 0 are allowed. The two referenced numeric values are Target Content Items of the first generation Composite Feature or Single Image Finding children of this composite feature. Given the equation, A - B, the value representing A shall be referenced first.

Qualitative Difference

The two referenced code values are Target Content Items of the first generation Composite Feature or Single Image Finding children of this composite feature.

TID 4006 Mammography CAD Single Image Finding

This Template describes a single image finding for a lesion or other object. The details of the finding are expressed in this Template and/or more specific Templates. The details from which a single image Calcification Cluster is inferred may be expressed in a number of Single Image Findings (see TID 4006 “Mammography CAD Single Image Finding”) of type Individual Calcification.

Content Item Descriptions

Rendering Intent
This Content Item constrains the SCP receiving the Mammography CAD SR IOD in its use of the contents of this Template and its Target Content Items. Mammography CAD devices may opt to use data marked "Not for Presentation" or "Presentation Optional" as input to subsequent mammography CAD processing steps. Refer to Section O.2 “Structured Reporting Storage SOP Class SCU and SCP Behavior” in PS3.4.

CAD Operating Point
Additional information to use when Rendering Intent is "Presentation Optional". A CAD Operating Point of zero is not sent, and is encoded as a Rendering Intent of "Presentation Required". See Section O.2 “Structured Reporting Storage SOP Class SCU and SCP Behavior” in PS3.4 and Section E.4 “CAD Operating Point” in PS3.17.

Single Image Finding
A Single Image Finding (whose parent is a Single Image Finding of type Calcification Cluster) allows one level of nesting for the definition of individual calcifications within the cluster. To use this Template recursively, this Single Image Finding code value shall be "Individual Calcification".

Certainty of Finding
The likelihood that the finding detected, and classified by the CODE specified in the Single Image Finding parent Template, is in fact that type of finding.

**Content Item Descriptions**

Image Quality Rating
A numeric value in the range 0 to 100, inclusive, where 0 is worst quality and 100 is best quality.

**TID 4015 CAD Detections Performed**

This Template gathers two lists of detection algorithms attempted, grouped by success/failure status. Algorithms not attempted are not mentioned in this sub-tree of the Document Root (e.g., TID 4000 "Mammography CAD Document Root"). This information forms the basis for understanding why a CAD report may produce no (or fewer than anticipated) detection results.

The sub-tree formed by this Template is illustrated in Figure E.1-2 “Summary of Detections and Analyses Levels of Mammography CAD SR Content Tree” in PS3.17.

**Content Item Descriptions**

If more than one detection algorithm has the same "Detection Performed" code value (e.g., CID 6014 "Mammography Single Image Finding") then the "CAD Algorithm Identification" shall unambiguously distinguish between algorithms.
Rows 5, 6
Mammography CAD SR: When this Template is invoked for the Mammography CAD SR, the Image Library is mandatory, thus only row 4 and/or row 6 shall be present.

Chest CAD SR: When this Template is invoked for the Chest CAD SR, the Image Library is optional, thus any combination of rows 3, 4, 5 and 6 may be present.

Colon CAD SR: When this Template is invoked for the Colon CAD SR, the Image Library does not exist, thus rows 3, 5, and/or 6 may be present and row 4 shall not be present.

Mammography CAD SR: When this Template is invoked for the Mammography CAD SR, the Image Library is mandatory, thus only row 8 shall be present.

Chest CAD SR: When this Template is invoked for the Chest CAD SR, the Image Library is optional, thus row 7 or 8 may be present.

Colon CAD SR: When this Template is invoked for the Colon CAD SR, the Image Library does not exist, thus only row 7 may be present.

TID 4020 CAD Image Library Entry

Each instance of the Image Library Entry Template contains the Image SOP Class and Instance UIDs, and selected attributes for an image that facilitate spatial analysis without having to retrieve the entire set of referenced images. If values for the attributes are not present in the Image SOP Instance, then as many of the attributes as possible should be derived.

#### Content Item Descriptions

- **Maximum CAD Operating Point**: The maximum possible value of CAD Operating Point for this type of Detection Performed. No CAD Operating Point value recorded in the CAD Processing and Findings Summary sub-tree of the report for this type of Detection Performed shall exceed this value. The report may or may not contain Rendering Intent = "Presentation Optional" detections that are assigned the maximum value.

- **Recommended CAD Operating Point**: A number indicating which of the CAD operating points is recommended by the creator of a CAD SR instance as the first operating point to be used when rendering the CAD SR instance contents. Subsequent changes to the displayed operating point are implementation dependent.

#### Chest CAD SR IOD Templates

The Templates that comprise the Chest CAD SR IOD are interconnected as in Figure A-9.
In Figure A-9, ‘···’ indicates possible recursive application of subordinate Templates.

**TID 4100 Chest CAD Document Root**

This Template forms the top of a content tree that allows a chest CAD device to describe the results of detection and analysis of chest evidence. This Template, together with its subordinate Templates, describes both the results for presentation to radiologists and partial product results for consumption by chest CAD devices in subsequent chest CAD reports.

This Template defines a Container that contains an Image Library, the CAD results, and summaries of the detection and analysis algorithms performed. The Image Library contains the Image SOP Class and Instance UIDs, and selected attributes for each image referenced in either the algorithm summaries or chest CAD results.

The atomic CAD results of Single Image Findings and Composite Features are described in the Chest CAD Findings Summary subtree.

The Summary of Detections and Summary of Analyses sub-trees gather lists of algorithms attempted, grouped by success/failure status. Algorithms not attempted are not mentioned in these sub-trees. This information forms the basis for understanding why a chest CAD report may produce no (or fewer than anticipated) results. Chest CAD results are constructed bottom-up, starting from Single Image Findings (see TID 4104 “Chest CAD Single Image Finding”), associated as Composite Features (see TID 4102 “Chest CAD Composite Feature”).

See Figure F.1-1 “Top Levels of Chest CAD SR Content Tree” in PS3.17.

### Content Item Descriptions

**Image Library**

The "Image Library" section of the Content Tree (TID 4100 “Chest CAD Document Root”, row 3) may include all Image SOP Instances from the Current Requested Procedure Evidence Sequence (0040,A375) attribute of the SR Document General module. If a portion of another instance of a Chest CAD SR IOD is duplicated in the "Chest CAD Findings Summary" section of the Content Tree, the "Image Library" may also include all Image Library Entries referenced from the duplicated portions of the Chest CAD SR.

The Image Library is intended to be used in cases where the acquisition context Content Items differ from image to image, such as different views and/or laterality in projection X-Ray.

**Detections Performed**

The "Detections Performed" and "Analyses Performed" sections of the Content Tree (TID 4100 “Chest CAD Document Root”, rows 7 and 9) together shall reference all Image SOP Instances included in the Current Requested Procedure Evidence Sequence (0040,A375) attribute of the SR Document General module.

**Analyses Performed**

The contents of this Template describe the findings and aggregate features that the chest CAD device detected for the chest evidence presented. This Template forms the chest CAD results sub-tree of the Chest CAD Document Root (TID 4100 “Chest CAD Document Root”).

---

**TID 4101 Chest CAD Findings Summary**

The contents of this Template describe the findings and aggregate features that the chest CAD device detected for the chest evidence presented. This Template forms the chest CAD results sub-tree of the Chest CAD Document Root (TID 4100 “Chest CAD Document Root”).
Root”). The data from which the details are inferred are expressed in the Composite Features (see TID 4102 “Chest CAD Composite Feature”) and/or Single Image Findings (see TID 4104 “Chest CAD Single Image Finding”), of which there may be several.

The sub-tree headed by this Template is illustrated in Figure F.1-2 “Example of CAD Processing and Findings Summary Sub-Tree of Chest CAD SR Content Tree” in PS3.17.

### Content Item Descriptions

| CAD Processing and Findings Summary | This code value is used to express if and why the Chest CAD Findings Summary sub-tree is empty. The Summary of Detections and Summary of Analyses sub-trees of the Document Root node contain detail about which (if any) algorithms succeeded or failed. If the code value indicates that there were no findings, then the code value can be used to determine whether chest CAD processing occurred successfully, without parsing the Summary of Detections and Summary of Analyses sub-trees. |

### TID 4102 Chest CAD Composite Feature

This Template collects a composite feature for a lesion, anatomy, non-lesion object, or correlation of related objects (see TID 4101 “Chest CAD Findings Summary”). The details of the composition are expressed in the Chest CAD Composite Feature Body (see TID 4103 “Chest CAD Composite Feature Body”). The data from which the details are inferred, are expressed in the Composite Features (see TID 4102 “Chest CAD Composite Feature”) and/or Single Image Findings (see TID 4104 “Chest CAD Single Image Finding”), of which there may be several.

A Composite Feature shall be INFERRED FROM any combination of two or more Composite Features or Single Image Findings or mixture thereof.

**Content Item Descriptions**

Anatomic Identifier - An identifier of an anatomic feature when a multiplicity of features of that type may be present, such as "Rib 1", "Rib 2" or thoracic vertebrae "T1" or "T2".
Rendering Intent: This Content Item constrains the SCP receiving the Chest CAD SR IOD in its use of the contents of this Template and its Target Content Items. Chest CAD devices may opt to use data marked "Not for Presentation" or "Presentation Optional" as input to subsequent chest CAD processing steps. Refer to Section O.2 "Structured Reporting Storage SOP Class SCU and SCP Behavior" in PS3.4.

**TID 4103 Chest CAD Composite Feature Body**

The details of a composite feature are expressed in this Template. It is applied to Chest CAD Composite Feature (TID 4102 "Chest CAD Composite Feature").

Content Item Descriptions

Certainty of Feature
The certainty of the CAD device that the feature analyzed and classified by the CODE, as specified in the Composite Feature parent Template, is in fact that type of feature.

Volume Measurement
If dimensions for a volume are to be stated in terms of length, width, and depth, then one shall use 3 instances of TID 1400 "Linear Measurement".

Row 9
Values ≤ 0 are allowed. The two referenced numeric values are Target Content Items of the first generation Composite Feature or Single Image Finding children of this composite feature. Given the equation, A - B, the value representing A shall be referenced first.

Qualitative Difference
The two referenced code values are Target Content Items of the first generation Composite Feature or Single Image Finding children of this composite feature.

TID 4104 Chest CAD Single Image Finding

This Template describes a single image finding for a lesion or other object. The details of the finding are expressed in this Template and/or more specific Templates.

Type: Non-Extensible
Order: Significant
Root: No

</table>

Colon CAD SR IOD Templates

The Templates that comprise the Colon CAD SR IOD are interconnected as in Figure A-9b. In Figure A-9b, ‘···’ indicates possible recursive application of subordinate Templates.

Figure A-9b. Colon CAD SR IOD Template Structure
**TID 4120 Colon CAD Document Root**

This Template forms the top of a content tree that allows a colon CAD device to describe the results of detection and analysis of colon evidence. This Template, together with its subordinate Templates, describes both the results for presentation to radiologists and partial product results for consumption by colon CAD devices in subsequent colon CAD reports.

This Template defines a Container that contains the CAD results and summaries of the detection and analysis algorithms performed. The atomic CAD results of Single Image Findings and Composite Features are described in the Colon CAD Findings Summary subtree.

The Summary of Detections and Summary of Analyses sub-trees gather lists of algorithms attempted, grouped by success/failure status. Algorithms not attempted are not mentioned in these sub-trees. This information forms the basis for understanding why a colon CAD report may produce no (or fewer than anticipated) results. Colon CAD results are constructed bottom-up, starting from Single Image Findings (see TID 4127 “Colon CAD Single Image Finding”), associated as Composite Features (see TID 4125 “Colon CAD Composite Feature”).

See Figure SS.1-1 “Top Levels of Colon CAD SR Content Tree” in PS3.17.

</tr>
</tbody>
</table>

**Content Item Descriptions**

- **Detections Performed**
  The "Detections Performed" and "Analyses Performed" sections of the Content Tree (TID 4120 “Colon CAD Document Root”, rows 6 and 8) together shall reference all Image SOP Instances included in the Current Requested Procedure Evidence Sequence (0040,A375) attribute of the SR Document General module.
TID 4121 Colon CAD Findings Summary

The contents of this Template describe the findings and aggregate features that the colon CAD device detected for the colon evidence presented. This Template forms the colon CAD results sub-tree of the Colon CAD Document Root (TID 4120 “Colon CAD Document Root”). The data from which the details are inferred are expressed in the Composite Features (see TID 4125 “Colon CAD Composite Feature”) and/or Single Image Findings (see TID 4127 “Colon CAD Single Image Finding”), of which there may be several.

The sub-tree headed by this Template is illustrated in Figure F.1-2 “Example of CAD Processing and Findings Summary Sub-Tree of Chest CAD SR Content Tree” in PS3.17.

</table>

Content Item Descriptions

| CAD Processing and Findings Summary | This code value is used to express if and why the Colon CAD Findings Summary sub-tree is empty. The Summary of Detections and Summary of Analyses sub-trees of the Document Root node contain detail about which (if any) algorithms succeeded or failed. If the code value indicates that there were no findings, then the code value can be used to determine whether colon CAD processing occurred successfully, without parsing the Summary of Detections and Summary of Analyses sub-trees. |

TID 4122 CAD Common Image Properties Entry

Each instance of the CAD Common Image Properties Entry Template contains selected attributes for a set of parallel contiguous equally spaced slices (with identical properties) from which CAD findings are derived.

**TID 4125 Colon CAD Composite Feature**

This Template collects a composite feature for a lesion, non-lesion object, or correlation of related objects (see TID 4121 “Colon CAD Findings Summary”). The details of the composition are expressed in the Colon CAD Composite Feature Body (see TID 4126 “Colon CAD Composite Feature Body”). The data from which the details are inferred, are expressed in the Composite Features (see TID 4125 “Colon CAD Composite Feature”) and/or Single Image Findings (see TID 4127 “Colon CAD Single Image Finding”), of which there may be several.

### Content Item Descriptions

Rendering Intent

This Content Item constrains the SCP receiving the Colon CAD SR IOD in its use of the contents of this Template and its Target Content Items. Colon CAD devices may opt to use data marked "Not for Presentation" or "Presentation Optional" as input to subsequent colon CAD processing steps. Refer to Section O.2 “Structured Reporting Storage SOP Class SCU and SCP Behavior” in PS3.4.

## TID 4126 Colon CAD Composite Feature Body

The details of a composite feature are expressed in this Template. It is applied to Colon CAD Composite Feature (TID 4125 “Colon CAD Composite Feature”).

Type: Non-Extensible
Order: Significant
Root: No

Content Item Descriptions

Certainty of Feature
The CAD device's certainty that the feature analyzed and classified by the CODE, as specified in the Composite Feature parent Template is, in fact, that type of feature.

Row 6
Values ≤ 0 are allowed. The two referenced numeric values are Target Content Items of the first generation Composite Feature or Single Image Finding children of this composite feature. Given the equation, A - B, the value representing A shall be referenced first.

Qualitative Difference
The two referenced code values are Target Content Items of the first generation Composite Feature or Single Image Finding children of this composite feature.

TID 4127 Colon CAD Single Image Finding
This Template describes a single image finding for a lesion or other object. The details of the finding are expressed in this Template and/or more specific Templates.

Content Item Descriptions

Rendering Intent
This Content Item constrains the SCP receiving the Colon CAD SR IOD in its use of the contents of this Template and its Target Content Items. Colon CAD devices may opt to use data marked "Not for Presentation" or "Presentation Optional" as input to subsequent colon CAD processing steps. Refer to Section O.2 “Structured Reporting Storage SOP Class SCU and SCP Behavior” in PS3.4.

CAD Operating Point
Additional information to use when Rendering Intent is "Presentational Optional". A CAD Operating Point of zero is not sent, and is encoded as a Rendering Intent of "Presentation Required". See Section O.2 “Structured Reporting Storage SOP Class SCU and SCP Behavior” in PS3.4 and Section E.4 “CAD Operating Point” in PS3.17.

Certainty of Finding
The certainty of the CAD device that the finding detected and classified by the Single Image Finding CODE specified is in fact that type of finding.

TID 4128 Colon CAD Descriptors

This Template provides qualitative detail for a Single Image Finding or Composite Feature. It is applied to Colon CAD Composite Feature (TID 4125 “Colon CAD Composite Feature”) and Colon CAD Single Image Finding (TID 4127 “Colon CAD Single Image Finding”).

<table>

- Standard -
Content Item Descriptions

Row 3
12 o'clock position is the anterior direction of the patient regardless of the positioning with respect to gravity; clockwise is from the point of view of an observer located closer to the anus than the finding being observed.

**TID 4129 Colon CAD Geometry**

All geometry Template invocations require specification of either the location of the center of the object, the outline, or both. Geometry is a property of single image findings (see TID 4127 “Colon CAD Single Image Finding”) and composite features (see TID 4125 “Colon CAD Composite Feature”).

**Breast Imaging Report Templates**

The Templates that comprise the Breast Imaging Report are interconnected as in Figure A-10.
Figure A-10. Breast Imaging Report Template Structure

**TID 4200 Breast Imaging Report**

This Template forms the content tree that allows a Breast Imaging Report device to describe the results of a radiologist's diagnostic interpretation of Breast Imaging (e.g., X-Ray mammography or breast ultrasound) evidence. This Template, together with its subordinate Templates, describes the results for presentation to clinicians, or for consumption by Breast Imaging Report devices for subsequent Breast Imaging Reports.

This Template shall be instantiated at the Root node only.

See Figure Q.1-1 “Top Level of Breast Imaging Report Content Tree” in PS3.17.

TID 4203 Breast Imaging Assessment

This Template provides the content of a Breast Imaging Assessment, for an overall assessment section for the entire report (see TID 4208 “Breast Imaging Report Supplementary Data”) or an assessment of a particular finding (see TID 4206 “Breast Imaging Report Finding Section”). This Template defines a code-based assessment of the interpretation results.

See Figure Q.1-5 “Breast Imaging Assessment Content Tree” in PS3.17.

TID 5001 OB-GYN Patient Characteristics

Patient Characteristic concepts in this Template, which may replicate attributes in the Patient Study Module, are included here as possible targets of by-reference relationships from other Content Items in the SR tree.

Note

Several of the concepts in this Template duplicate concepts in TID 1007 "Subject Context, Patient". The difference in use is that this Template has those concepts as primary observations of the patient, while in TID 1007 "Subject Context, Patient" the concepts are used to set (or reset) the context for other observations.

</tr>
</tbody>
</table>
**Content Item Descriptions**

**Row 1**
Container to segregate biometry data by measurement type.

**Row 2**
The discrete measurements of the biometry type including derived measurements such as mean. One of
the measurements may be flagged as selected for derived measurements.

The anatomic location may be precoordinated in the measurement type, but may also be explicitly conveyed
in the $TargetSite parameter, which then also allows laterality to be encoded within TID 300 “Measurement”.

**Row 3**
The estimated gestational age derived from an equation or table based on the explicitly referenced
R-INFERRED FROM Content Item, selected measurement or mean, in that order of preference.

**Row 4**
The reference that defines the equation or table of GA derivation.

**Row 6**
The uncertainty/confidence limits of the gestational age.

**Row 7**
Expresses the rank of the selected or mean measurement of row 2 relative to the distribution specified in
row 8.

**Row 8**
This row specifies the CODE reference used to compute the percentile or Z-score.

### TID 5101 Vascular Patient Characteristics

Patient Characteristic concepts in this Template, which may replicate attributes in the Patient Study Module, are included here as possible targets of by-reference relationships from other Content Items in the SR tree.

Note

Several of the concepts in this Template duplicate concepts in TID 1007 “Subject Context, Patient”. The difference in use is that this Template has those concepts as primary observations of the patient, while in TID 1007 “Subject Context, Patient” the concepts are used to set (or reset) the context for other observations.

**Content Item Descriptions**

- **Row 1**: Specifies the anatomic context of the observations in the group.
- **Row 2**: Details the anatomical location, e.g., proximal, middle, or distal
- **Row 3**: The particular vessel branch, such as the inferior, medial or lateral
- **Row 5**: Cardiac phase (systolic, diastolic), especially for aorta measurements
- **Row 6**: Eating phase, especially for mesenteric and celiac measurements

### TID 5105 Ultrasound Graft Section

This Template is a container of measurements on a vascular graft.

Content Item Descriptions

- Proximal anastomosis: The proximal location of the graft
- Distal anastomosis: The distal location of the graft
- Graft type: The type of graft, e.g., "in situ", "prosthetic", "autogenous"

**Echocardiography Procedure Report Templates**

**TID 5200 Echocardiography Procedure Report**

This Template forms the top of a content tree that allows an ultrasound device to describe the results of an adult echocardiography imaging procedure. It is instantiated at the root node. It can also be included in other Templates that need to incorporate echocardiography findings into another report as quoted evidence.

**Content Item Descriptions**

Row 24: The wall motion findings of stress stage. There may be multiple Template instances to report wall motion findings of multiple stages.

**TID 5201 Echocardiography Patient Characteristics**

Patient Characteristic concepts in this Template, which may replicate attributes in the Patient Study Module, are included here as possible targets of by-reference relationships from other Content Items in the SR tree.

**Note**

Several of the concepts in this Template duplicate concepts in TID 1007 “Subject Context, Patient”. The difference in use is that this Template has those concepts as primary observations of the patient, while in TID 1007 “Subject Context, Patient” the concepts are used to set (or reset) the context for other observations.

Content Item Descriptions

Row 3: The stage of the protocol at which these findings were scored. This row may be absent if this is a generic, non-staged scoring.

Row 4: Image that graphically depicts the segments and their scores.

Row 5: Text narration accompanying this stage.

Row 6: The composite score computed from the average of the scored segments

Row 7: The type of scoring scheme used to score this exam.

Row 8: A container of all of the individual segment findings for this stage. The container shall be present if the observer makes an assessment, including the assessment of Not Visualized. It shall not be present if no evaluation was made.

Rows 11, 12: Scar/thinning (in Row 12) may accompany akinesis and dyskinesis (in Row 11).

Row 13: A numeric designation for the score. Score ranges vary, typically 0-4 or 0-5. Numeric scores may depend on wall motion findings as well as morphology findings. See Table 5204-1 for conventional numeric assignment schemes. The UCUM annotation code enables specifying the numeric range, (L:N), UCUM, "scale L:N"), where L and N are the lower and upper ends of the range.

**TID 5223 Pediatric, Fetal and Congenital Cardiac Ultrasound Measurement**

This Template provides for the post-coordination of a measurement with a variety of concept modifiers and acquisition context observations. When invoked from TID 5222 “Pediatric, Fetal and Congenital Cardiac Ultrasound Section”, the measurement concept is
implicitly post-coordinated with the concept modifiers of the Measurement Group (TID 5222 “Pediatric, Fetal and Congenital Cardiac Ultrasound Section” Rows 5 and 6), and with the Finding Site of the report section (TID 5222 “Pediatric, Fetal and Congenital Cardiac Ultrasound Section” Row 2). The finding site may be further specified within this Template by the Target Site and Target Site Modifiers (CID 12280 “Cardiac Ultrasound Target Sites” and CID 12281 “Cardiac Ultrasound Target Site Modifiers”).

The implicit finding site inherited from TID 5222 “Pediatric, Fetal and Congenital Cardiac Ultrasound Section” can be made explicit by using the same finding site concept in the Target Site (the measurement concept modifier), rather than a term from CID 12280 “Cardiac Ultrasound Target Sites”. This explicit post-coordination allows the use of one of the modifiers of CID 12281 “Cardiac Ultrasound Target Site Modifiers” to that finding site, as the Target Site Modifier requires an explicit Target Site in the measurement structure (TID 300 “Measurement” Rows 5 and 7). In fact, any child concept of the finding site in the SNOMED hierarchy may be used as the measurement Target Site.

The finding or target site may be identified by a concept from the SNOMED "clinical finding" or "morphological anomaly" hierarchies (e.g., D4-31220 "Atrial Septal Defect", or M-36700 "Effusion"), rather than the "anatomical structure" hierarchy. In this case, the meaning is inferred as "the anatomic location of the clinical finding or morphological anomaly, within the constraints of other implicit or explicit post-coordinated finding site concepts."

Note
Thus when TID 5221 “Cardiac Ultrasound Pediatric Echo Measurement Section” Row 14 invokes TID 5222 “Pediatric, Fetal and Congenital Cardiac Ultrasound Section” with the section finding site concept (T-39000, SRT, "Pericardium"), and TID 5223 “Pediatric, Fetal and Congenital Cardiac Ultrasound Measurement” Row 1 applies the target site (M-36700, SRT, "Effusion"), the effective finding site is "pericardial effusion".

## Content Item Descriptions

**Row 1**

For an index type of measurement, the concept name of this row 1 will still be the original measurement concept name; it is row 2 that gives the indication that row 1 is actually an index type of measurement. When this happens, the measurement value of row 1 should be a value after being indexed and the measurement unit of row 1 should be an index type of unit.

For example, to insert a "Stroke Volume Index" measurement to this SR object, the concept name of row 1 will be "Stroke Volume", its numerical value will be the calculation result of "Stroke Volume / BSA" and its units are "ml/cm2".

**Row 2**

When this row is available, the row 1 is an index calculation of the object.

**Simplified Adult Echocardiography Templates**

The templates that comprise the Simplified Adult Echocardiography Report are interconnected as in Figure A-10b.
This template forms the top of a content tree that allows an ultrasound device to describe the results of an adult echocardiography imaging procedure.

The template is instantiated at the root node. It can also be included in other templates that need to incorporate echocardiography findings into another report as quoted evidence.

This template does not include an Image Library. Image Content Items in the Echo Measurement templates (for example to indicate Source of Measurement) shall be included with by-value relationships, not with by-reference relationships.

Measurements in this template (except for the Wall Motion Analysis) are collected into one of three containers, each with a specific sub-template and constraints appropriate to the purpose of the container.

- **Pre-coordinated Measurements**
  - Are fully standardized measurements (many taken from the ASE practice guidelines).
  - Each has a single pre-coordinated standard code that fully captures the semantics of the measurement.
  - The only modifiers permitted are to indicate coordinates where the measurement was taken, provide a brief display label, and indicate which of a set of repeated measurements is the preferred value. Other modifiers are not permitted.

- **Post-coordinated Measurements**
  - Are non-standardized measurements that are performed with enough regularity to merit the control and configuration to capture the full semantics of the measurement. For example these measurements may include those configured on the cart by the vendor or user site. Some of these may be variants of the Pre-coordinated Measurements.
  - A set of mandatory and conditional modifiers with controlled vocabularies capture the essential semantics in a uniform way.
  - A single pre-coordinated code is also provided so that when the same type of measurement is encountered in the future, it is not necessary to parse and evaluate the full constellation of modifier values. Since this measurement has not been fully standardized, the pre-coordinated code may use a private coding scheme (e.g., from the vendor or user site).

- **Adhoc Measurements**
  - Are non-standardized measurements that do not merit the effort to track or configure all the details necessary to populate the set of modifiers required for a post-coordinated measurement.
  - The measurement code describes the elementary property measured.
- Modifiers provide a brief display label and indicate coordinates where the measurement was taken. Other modifiers are not permitted.

For an example of this encoding and a discussion of the benefits and use cases, see Annex CCCC Populating The Simplified Echo Procedure Report Template (Informative) in PS3.17.

**Content Item Descriptions**

Row 8  
A text string containing one or more sentences describing one or more indications, possibly with additional comments from the physician or tech.

Row 11  
These are measurements from a standardized list of pre-coordinated codes. See CID 12300 "Core Echo Measurements". Measurements which do not correspond to the full semantics of one of the pre-coordinated codes in CID 12300 can likely be encoded in Row 13 instead.

Multiple instances of the same measurement code may be present in the container. Each instance represents a different sample or derivation.

This template makes no requirement that any or all samples be sent. For example, a mean value of all the samples of a given measurement could be sent without sending all or any of the samples from which the mean was calculated.

Device configuration and/or operator interactions determine what measurements are sent.
Row 13  These are measurements that can be encoded using a standardized structure of post-coordinated codes. Measurements which correspond to the full semantics of one of the pre-coordinated codes in CID 12300 “Core Echo Measurements” should be encoded in Row 11 instead.

$Measurement shall be provided, but is not constrained to a CID.

Multiple instances of the same measurement code may be present in the container. Each instance represents a different sample or derivation.

This template makes no requirement that any or all samples be sent. For example, a mean value of all the samples of a given measurement could be sent without sending all or any of the samples from which the mean was calculated. Device configuration and/or operator interactions determine what measurements are sent.

Row 15  These are adhoc measurements encoded with minimal semantics.

Row 13 can be used to encode measurements with more complete semantics.

$Units shall be provided, but is not constrained to a CID.

Device configuration and/or operator interactions determine what measurements are sent.

Rows 17-24  When present, these rows contain measurements and associate them with a specific stage of a staged procedure.

TID 5301 Pre-coordinated Echo Measurement

This template codes numeric echo measurements where most of the details about the nature of the measurement have been pre-coordinated in the measurement code. In contrast, see TID 5302 “Post-coordinated Echo Measurement”.

The pre-coordinated measurement code is provided when this Template is included from a parent Template.

</tbody>
</table>

**Row 2**
The reason that this value was selected as the preferred value for the measured concept.

The parent template may allow TID 5301 “Pre-coordinated Echo Measurement” to be included multiple times with the same Measurement Concept Name, for example to allow multiple samples of the measurement. A given Measurement Concept Name might appear only once in the instance, in which case this this row may or may not be present. A given Measurement Concept Name may appear multiple times, however this row shall not be present for more than one value of the given Measurement Concept Name. E.g. multiple measurements of (11706-9, LN, "Aortic Valve Peak Systolic Flow") may be present, but only one may be selected as preferred.

**Row 3**
The method used to derive this measurement value from multiple samples of the Measurement Concept Name.

If Row 3 is not present, then this measurement value is simply a single sample of the Measurement Concept Name.

*Note*
A measurement value that is a mean value of other measurements and was also selected as the preferred value because it is the mean will have both Row 2 and Row 3 present.

**Row 6**
This may be used to label the measurement value when space is limited on the screen or report page. E.g. a Short Label of "LVIDD" might be provided for measurement of the left ventricle internal diameter at end diastole.

*Note*
Short Labels are not standardized and may omit details of the measurement, thus it is not recommended to use them for purposes such as matching.

### TID 5302 Post-coordinated Echo Measurement

This template codes numeric echo measurements where most of the details about the nature of the measurement have been post-coordinated in modifiers and acquisition context. In contrast, see TID 5301 “Pre-coordinated Echo Measurement”.

This template is intended to be used for User-defined and Vendor-defined Echo Measurements.

Several modifier rows are conditional and are omitted when the modifier concept is not significant for the measurement encoded in the item. When these modifiers are included by the sender, it indicates that the modifier concept is significant and receivers will generally treat the measurements differently than similar measurements sent that omit that modifier.

*Note*
The codes in the CIDs referenced below were sufficient to accurately encode all the best practice echo measurements recommended by the ASE. If, however, a new code is needed to record a specific User-defined or Vendor-defined measurement, most of the CIDs are extensible. It is not unreasonable to expect that measurements might be made at other Finding Sites than those listed in CID 12305 “Basic Echo Anatomic Sites”, or using Measurement Methods beyond those listed in CID 12227 “Echocardiography Measurement Method”.

The concept modifiers in the template below were sufficient to accurately encode all the best practice echo measurements recommended by the ASE. Although TID 5302 “Post-coordinated Echo Measurement” is extensible and adding new modifiers is not prohibited, the meaning and significance of such new modifiers will generally not be understood by receiving systems, delaying or preventing import of such measurements. Further, adding modifiers that replicate the meaning of an existing modifier is prohibited.
If such measurements cannot be encoded with the following structure, an implementation may choose to code the measurement in TID 5303 “Adhoc Measurement”, or to use TID 5200 “Echocardiography Procedure Report” instead of TID 5300 “Simplified Echocardiography Procedure Report”.

**Content Item Descriptions**
Row 1 | A fully pre-coordinated code that incorporates all the semantics of Rows 7-17 for this measurement.  
The code is intended to allow parsers to recognize post-coordinated measurements that have been previously encountered, thus facilitating incorporation of the measurement into databases, report templates, registries, etc. Typically these codes will be from a vendor or site specific coding scheme, e.g., 99ACME. Sending the same code consistently in different reports will depend on the recording system maintaining a stable list of these pre-coordinated codes. Such a list might be configured or internally generated and managed.  
This shall be populated by the recording system. If the recording system does not have a method to ensure that all occurrences of the same post-coordinated measurement use the same code, it shall use the code (125304, DCM, "Untrackable Measurement").

Note  
1. Two measurements with the same pre-coordinated code have, by definition, the same semantics (except for "Untrackable Measurements")  
2. Two measurements with the same constellation of modifier values have the same semantics but may have different pre-coordinated codes because they  
   • come from carts of different vendors who don't share the same code table  
   • come from carts of the same vendor, but the carts don't share the same code table  
   • come from the same cart, but it's code table has been modified  
   • come from the same cart, but it does not maintain a code table  
3. Two measurements with the same constellation of modifier values and different pre-coordinated codes have the same semantics and the receiver is entitled to treat them as the same (with respect to the scope of those modifiers)  
4. Recommended units for various Measured Properties (Row 10) can be found in the Units column of CID 12304 “Echo Measured Properties” .  
5. When the Measurement Type (Row 7) is (125313, DCM, "Indexed") , (G-D750, SRT, "Ratio") or (125314, DCM, "Fractional Change") , the Units for Row 1 corresponds to the fully calculated $Measurement, incorporating both the numerator (Row 10) and the denominator (Row 17). E.g. a measure of Left Ventricular Outflow Tract Diameter / BSA would have units of (cm/m2, UCUM, "cm/m2") in Row 1, (125313, DCM, "Indexed") in Row 7, (M-02550, SRT, "Diameter") in Row 10, and (8277-6, LN, "Body Surface Area") in Row 17.

Row 2 | One or more additional fully pre-coordinated codes which are semantically equivalent to the code in Row 1.  
This may be used to communicate known mappings, such as to national registry codes or other vendors' codes.

Row 3 | The reason that this value was selected as the preferred value for the measured concept.  
The parent template may allow TID 5301 “Pre-coordinated Echo Measurement” to be included multiple times with the same Measurement Concept Name, for example to allow multiple samples of the measurement.  
A given Measurement Concept Name might appear only once in the instance, in which case this this row may or may not be present. A given Measurement Concept Name may appear multiple times, however this row shall not be present for more than one value of a given measured concept. E.g. multiple measurements of (11706-9, LN, "Aortic Valve Peak Systolic Flow") may be present, but only one may be selected as preferred.
The method used to derive this measurement value from multiple samples of the Measurement Concept Name. If Row 3 is not present, then this measurement value is simply a single sample of the Measurement Concept Name.

Note
1. A measurement value that is a mean value of other samples and was also selected as the preferred value because it is the mean will have both Row 2 and Row 3 present.
2. This row is not used to record whether the measurement value is a direct measurement vs a measurement calculated from an equation. Such information is recorded in Row 7.

Row 8
The finding site reflects the anatomical location where the measurement is taken. CID 12305 “Basic Echo Anatomic Sites” contains the codes which proved to be sufficient for mapping the full set of ASE standard measurements. It is recommended to use these locations unless a more detailed location is truly necessary.

Row 9
The finding observation type indicates the type of observation made at the finding site to produce the measurement. In many cases, for example Aortic Root Diameter, the structure of the finding site is being observed. In other cases, for example Mitral Valve Regurgitant Flow Peak Velocity, the finding site is the mitral valve, the hemodynamic flow (not the valve structure) is being observed, the measured property is the peak velocity, and the flow direction is retrograde.

Row 17
The pre-coordinated code for the measurement that has been used as the denominator of this measurement. Only applies to measurements of type Indexed, Ratio or Fractional Change.

The measurement referenced as the Measurement Divisor shall be present in the instance in which it is used. When Row 17 is present, any values in Rows 5-6, 8-16 shall reflect the numerator of the measurement rather than the Index, Ratio or Fractional Change as a whole. E.g. in the case of an Indexed measurement, the value recorded in Row 1 has already been divided by the Index referenced in Row 17, and the Units in Row 1 match the indexed value, not the numerator Property described in Row 10.

For a measurement of type Indexed, the numerator is divided by the Measurement Divisor.

For a measurement of type Ratio, the numerator is divided by the Measurement Divisor and is unitless.

For a measurement of type Fractional Change, the numerator is first subtracted from the Measurement Divisor and the result divided by the Measurement Divisor (i.e., (Divisor - Numerator) / Divisor).

Row 18
This may be used to label the measurement value when space is limited on the screen or report page. E.g. a Short Label of "LVIDD" might be provided for a measurement of the left ventricle internal diameter at end diastole.

Note
Short Labels are not standardized and may omit details of the measurement, thus it is not recommended to use them for purposes such as matching.

**TID 5303 Adhoc Measurement**

This Template codes numeric echo measurements where most of the details about the nature of the measurement are not communicated. The measurement is identified in terms of the property measured, such as Length, Diameter, Area, Velocity etc. and some measurement context may established by reference to spatial coordinates on an image or a waveform. A displayable label is included but there is no managed code identifying the measurement.

The template is intended to be used to include adhoc, one-time measurements whose need is determined during imaging exam or reviewing session.
Measurements that are taken in an adhoc fashion but are selected from the set of pre-coordinated or post-coordinated measurements that are configured on the Ultrasound System should be coded using TID 5301 “Pre-coordinated Echo Measurement” or TID 5302 “Post-coordinated Echo Measurement”.

### Implantation Plan SR Document Templates

The Templates that comprise the Implantation Plan SR Document IOD are interconnected as in [Figure A-11](#).

**Figure A-11. Implantation Plan SR Document IOD Template Structure**
TID 7000 Implantation Plan

This Template contains all the necessary information to position an Implant Assembly and its Components in a patient. Therefore, all the Components that comprise an Implant Assembly are listed. If the Implant Assembly consists of more than one Component, the relation between the Components will be described as well. It is also possible to describe the registration between the Components and the patient and between the Components themselves.

To reference the Components within this document the Implantation Plan Component ID is used.

The Component Connection links two Implantation Plan Components in a commutative way. This means that for each link between A and B only one Component Connection has to be defined and not two for A-B and B-A.

The terminology used is defined by illustration using the example in Figure A-12.

Acquisition Context SR IOD Templates

The Templates that comprise the Acquisition Context SR are interconnected as follows:

- TID 8101 “Preclinical Small Animal Image Acquisition Context”
  - TID 1204 "Language of Content Item and Descendants"
  - TID 1001 “Observation Context”
  - TID 8110 “Biosafety Conditions”
  - TID 8121 “Animal Housing”
  - TID 8122 “Animal Feeding”
  - TID 8140 “Heating Conditions”
  - TID 8150 “Circadian Effects”
  - TID 8170 “Physiological Monitoring Performed During Procedure”
  - TID 8130 “Anesthesia”
    - TID 8131 “Medications and Mixture Medications”
    - TID 9002 “Medication, Substance, Environmental Exposure”
    - TID 8182 “Exogenous Substance Administration”

TID 8101 Preclinical Small Animal Image Acquisition Context

This root template encodes a description of the conditions present during and related to data acquisition for a single imaging procedure.

Note

1. It is not expected that a single instance be used to describe the entire life of an animal, unless it is sacrificed after a single procedure. Rather, separate instances will be used for separate procedures, though there may be some duplication of common information, such as about the home cage environment.

2. It is expected that an SR instance encoded using this template will be contained in the same Study as other instances created during the procedure, e.g., with a common Study Instance UID. If this is not practical, e.g., due to recording on
If a separate device without use of a shared Modality Worklist, then commonality of other Study level attributes may be necessary to link procedures (and possibly coerce the Study Instance UID to a common value).

**Type:** Extensible  
**Order:** Non-Significant  
**Root:** Yes

### Content Item Descriptions

**Row 3**
A single pre-coordinated code describing the general type of imaging procedure can be described using TID 1005 Row 9 Procedure Code (included in TID 1001). For small animal (as opposed to human) imaging, this will likely describe a whole body acquisition in a modality-specific manner and the use of contrast and/or radiopharmaceutical. E.g., whole body FDG PET, or whole body DCE-MRI.

May be redundant with (or default to) the value present in the top level data set in Procedure Code Sequence (0008,1032) of the General Study Module.

Species and strain identification is not described in TID 1001; rather it is encoded in DICOM Attributes in the top level data set.

**Row 5**
The biosafety conditions are expected to be consistent across all phases of handling, so are not described separately per-phase.

**Rows 8-9**
The period of time during which the phase is defined, i.e., during which the animal was managed in the specified conditions. This may be more important for interpretation for some phases (e.g., transport) than others (e.g., at rest in the home cage), and hence is optional.

**Rows 10-14**
The outline of subordinate templates follows the pattern of categories of Animal Housing, Care, and Physiologic Monitoring information described in [Stout et al 2013].

**Row 11**
Animal feeding is 1-n to allow encoding of dietary supplements and treats in addition to the regular diet.

**Row 15**
A single anesthesia event is normally assumed for a single procedure, though the template included can include multiple pre-, intra- and post-procedure descriptions.

**Row 16**
Used to describe pharmaceuticals administered that are not described elsewhere, in particular, those that are not described as anesthesia medications, and those that are not described in the images (e.g., contrast, radiopharmaceuticals). This includes therapy (such as chemotherapy, immunotherapy) and similar interventions that may be the subject of the research.

The value set of $CodeValue is not defined, given the vast range of possible codes and coding schemes for drugs or medicaments that might be used. Nor are value sets for $Classification or $Site defined.
Row 17  Used to describe non-pharmaceutical exogenous substances administered, such as cells or other tumor graft, fibrils, viruses, cytokines and toxins that describe the "model" upon which the research is being performed, as distinct from the "therapeutic intervention" (Row 16) that may be the purpose of the research. The Classification parameter is not constrained by any value set.

TID 8110 Biosafety Conditions

This template encodes a description of the biosafety conditions applicable to research small animals.

Type: Extensible
Order: Non-Significant

Content Item Descriptions

Row 4  A brief description of any pertinent or unusual biosafety requirements.

TID 8121 Animal Housing

This template encodes a description of housing of animals, e.g., in home cages, holders for imaging, etc., over an interval during which environmental and handling conditions are relatively homogenous.

Note

1. Only "static" parameters of the design and setup are recorded, and "nominal" values for environmental conditions such as humidity and temperature, but not "dynamic" parameters that might vary during one housing interval, and potentially be monitored, such as oxygen or ammonia levels, temperature, humidity, urine or fecal corticosterone levels, etc.

2. Values for product names and codes are expected to be accurate at the time the information is recorded, recognizing that products may evolve over time.

Type: Extensible
Order: Non-Significant

<table>
<thead>
<tr>
<th>Row 2 and 2b</th>
<th>The type and identifier of the entire room in which, for example, one or more racks of housing units is located, not the housing unit itself.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Row 3</td>
<td>The manufacturer is expected to be the same for all housing unit components, rack, bottom and lid.</td>
</tr>
<tr>
<td>Row 12</td>
<td>The position in the rack is encoded as text since it may be an &quot;identifier&quot; or a description. It is not a set of numeric (e.g., row, column) or coded (e.g., top, bottom or middle) values, since there are too many possible arrangements.</td>
</tr>
<tr>
<td>Row 13</td>
<td>The number of animals usually applies to a single housing unit, but may also be used to describe the number of animals imaged simultaneously in a multi-animal imaging carrier or support device (&quot;chamber&quot;, &quot;holder&quot;, etc.).</td>
</tr>
<tr>
<td>Rows 20-22</td>
<td>These may be internal or external dimensions, and are intended to provide an approximation of the living space and shape available.</td>
</tr>
<tr>
<td>Rows 25-26</td>
<td>Description of measured or monitored or nominal values of temperature and humidity. The means of maintaining these conditions, if relevant, is described elsewhere (e.g., in the case of peri-procedural temperature control, in TID 8140 &quot;Heating Conditions&quot;).</td>
</tr>
<tr>
<td>Rows 28-29</td>
<td>The bedding material may be described as a code or text, or both. The codes do not distinguish between methods of sterilization of the bedding material (e.g., irradiation, autoclaving or other heat treatment), since that is not a relevant factor for image interpretation. The definition of the NCIt concept is &quot;that which comprises the place where a subject sleeps&quot;.</td>
</tr>
<tr>
<td>Row 35</td>
<td>The definition of the NCIt concept is &quot;a replacement of the existing materials that make up the sleeping area of a subject&quot;, and is used here to specify the interval between bedding changes.</td>
</tr>
<tr>
<td>Row 36-37</td>
<td>The presence or absence of enrichment material is coded, but the type is not, and may be described as text, e.g., &quot;facial tissue&quot;, &quot;cotton (nesting material)&quot;.</td>
</tr>
<tr>
<td>Row 38-39</td>
<td>The presence or absence of an exercise device is coded, but the type is not, and may be described as text.</td>
</tr>
</tbody>
</table>

### TID 8122 Animal Feeding

This template encodes a description of feeding and watering of animals, over an interval during which conditions are relatively homogenous.

**Note**

1. No specific time interval during which the diet is applicable is described.
2. Values for product names and codes are expected to be accurate at the time the information is recorded, recognizing that products may evolve over time.

**Type:** Extensible

**Order:** Non-Significant

</table>

**Content Item Descriptions**

Rows 1-3  If this template is used, at least one description of anesthesia method is required. Note that the specific agents used are described separately, as intra-operative medications, per the [AQI Schema](#).

Rows 6-7  These correspond to AQI elements that are named "Time" rather than "DateTime", though their value is a DateTime; the DICOM naming convention is used here.

Row 9  Only inhalational methods of maintenance are included in this row. Absence of this row implies that the (non-inhalational) induction method is used for maintenance.

Row 10  The comment corresponds to AQI element "Anesthesia Notes".

Rows 11-13  At least one description of airway management is required.

The airway management method also serves as the description of the method of inhalational anesthesia delivery, even if it does not involve "management" of the "airway" per se (e.g., delivery via nose cone).
Rows 15-17: In the AQI model, a single AQI MedicationsSet is used in the AQI IntraOp element to describe intra-operative medications. This template allows a more general usage, with one or more Medications Set containers, each of which may be qualified by the phase of the procedure (pre-operative, intra-operative or post-operative). The purpose of the medication (e.g., general anesthetic) is described in the "Medication Type" of the included TID 8131 “Medications and Mixture Medications”.

TID 8131 Medications and Mixture Medications

This template encodes a description of medications (including but not limited to anesthetic agents) used during a procedure (e.g., anesthesia for imaging of research small animals).

Note

This template combines selected concepts from the [AQI Schema] elements, their complex types, and their children:

Type: Extensible
Order: Non-Significant

Content Item Descriptions
Row 1  AQI Medication type and element correspond to (F-04460, SRT, "Medication given") (situation). (See TID 3806 Cath Procedure).

Rows 2-3  AQI DoseStart and DoseEnd elements correspond to (122081, DCM, "Drug start") and (122082, DCM, "Drug end") respectively. (See CID 3409 Administration of Drugs/Contrast). If the medication is delivered as a bolus, the end time is omitted.

Row 4  AQI MedicationRoute corresponds to (G-C340, SRT, "Route of administration"). The existing CID 11 "Route of Administration" contains a relevant subset of concepts for the enumerated values of AQI MedicationRouteCodeType.

Row 5  The AQI schema allows the Medication type not only to describe medications with a single component, but also to add MixtureMedications children, each of which is encoded following a similar pattern to the contents of Medication, though the start and end time and route of administration are shared. This had been modeled by allowing every medication to have one or more mixture children. For medications that are not a mixture, a single instance of this row defines the medication (even though the mixture container is still used).

Rows 6, 7  AQI MedicationName and MixtureMedicationName elements correspond to (122083, DCM, "Drug administered"). (See TID 3806 Cath Procedure). The medication (e.g., anesthesia agent) can be described with a code or text, e.g., (F-61B0A, SRT, "Isoflurane") or "isoflurane".

Row 9  Both AQI MedDose (or MixtureMedDose) and DoseUnits (or MixtureDoseUnits) elements are combined in one content item. Units are required to be encoded as UCUM but are not otherwise constrained.

Row 10  Both AQI MedConcentration (or MixtureMedConcentration) and MedConcentrationUnit (or MixtureMedConcentrationUnit) elements are combined in one content item. Units are required to be encoded as UCUM but are not otherwise constrained.

**TID 8140 Heating Conditions**

This template encodes a description of the heating conditions applied prior to, during or after data acquisition (e.g., during imaging of research small animals).

**Type:** Extensible

**Order:** Non-Significant

<table>

</tbody>
</table>

**Content Item Descriptions**
Phase during which the conditions are applicable may be implicit in the context of invocation of this template (e.g., TID 8101 "Preclinical Small Animal Image Acquisition Context" Row 7), or explicitly specified.

The definition (from MESH) is "The application of heat to raise the temperature of the environment, ambient or local, or systems for accomplishing this effect".

This is the nominal temperature of the heating device (e.g., heating pad) and/or the set point of the feedback regulation device.

**TID 8150 Circadian Effects**

This template encodes a description of the Circadian effects relevant during data acquisition (e.g., during imaging of research small animals).

**Type:** Extensible  
**Order:** Non-Significant

<table>
<thead>
<tr>
<th>Table TID 8150. Circadian Effects</th>

| 4     | >                   | CONTAINS  | TIME | EV (127215, DCM, "Lights on time of day") | 1-n   | U           |                        |

**Content Item Descriptions**

Row 2 | Usually 24 hours.
Row 3 | The definition is "the amount of ambient light/darkness to which a subject is exposed in a period of time"; also mapped to CDISC "the period of light that a subject is exposed to in a period of time, usually expressed as the amount of time in a 24 hour cycle".
Row 4 | Can only be encoded if the light-dark cycles are aligned to a 24 hour clock. May be multiple if either multiple cycles occur during a 24 hour period, or if the cycle is longer than a 24 hour period and a multiple of 24 hours in duration.

**TID 8170 Physiological Monitoring Performed During Procedure**

This template encodes a description of the physiological monitoring performed during a period of time during or related to a data acquisition procedure (e.g., imaging of research small animals).

**Type:** Extensible  
**Order:** Non-Significant

<table>
<thead>
<tr>
<th>Table TID 8170. Physiological Monitoring Performed During Procedure</th>

Content Item Descriptions

Row 2 | There is no non-surgical procedure non-specific variant of (P2-34122, SRT, "Monitoring of electrocardiogram at surgery"). (P2-31209, SRT, "Continuous electrocardiogram monitoring") is intended for non-procedural (e.g., 24-hour) monitoring. So a more generic code for any kind of monitoring is used.

TID 8182 Exogenous Substance Administration

This template provides detailed information on a research subject's exposure to exogenous substances. It is a specialization of the more general template TID 9002 “Medication, Substance, Environmental Exposure”.

Table TID 8182. Parameters

<table>
<thead>
<tr>

**Content Item Descriptions**
Row 3  Classification is inherited from the more general template TID 9002 “Medication, Substance, Environmental Exposure”, and may be supplied as a parameter, but is entirely generic and is not used as an alternative to the more specific information provided in other rows, for example, Rows 19 and 20, tissue and taxonomic rank of origin.

Row 11  Brand name may be used for any type of descriptor or identifier. E.g., a particular cell line might have a designated name, such as "MDA-MB-468", which designates a particular human breast cancer cell line.

Rows 22-27  These rows describe the strain and genetic modifications of the source of the graft using content items that correspond to the Attributes described in Section C.7.1.1.1.4 “Patient Strain and Genetic Modifications” in PS3.3. The strain and genetic characteristics of the animal into which the exogenous substance is grafted are described in the Patient Module; see Section C.7.1.1.1.4 “Patient Strain and Genetic Modifications” in PS3.3.

Relevant Patient Information Templates

TID 9000 Relevant Patient Information for Breast Imaging

This Template collects a patient's relevant information as it relates to breast imaging. This Template, together with its subordinate Templates, describes the history of a patient's reproductive system, hormone medications, past procedures, risk factors, and indicated problems as they relate to breast health.

Content Item Descriptions

Row 3 | Classification is mapped in UMLS to (C0008902, UMLS, "Classification"). Its definition is completely generic; i.e., it does not refer to any particular type of classification.

Rows 13 & 14 | If both of these Content Items are instantiated, the concept names selected for each should match. For example, use "Relative dose amount" as the concept name for row 13 with "Relative dose frequency" as the concept name for row 14.

Row 15 | Even though the concept name is route of administration, it is also used for route of exposure in the case of environmental exposure.

Rows 16 and 17 | This pattern of route with a site and laterality modifier follows that used in TID 10022 “Radiopharmaceutical Administration Event Data”.

TID 9003 Previous Procedure

This general Template provides detailed information on a patient’s previous procedure, surgery, or treatment.

**X-Ray Radiation Dose SR IOD Templates**

The Templates that comprise the X-Ray Radiation Dose SR are interconnected as in Figure A-14.
Figure A-14. X-Ray Radiation Dose SR IOD Template Structure

TID 10001 Projection X-Ray Radiation Dose

This Template defines a container (the root) with subsidiary Content Items, each of which represents a single projection X-Ray irradiation event entry or plane-specific dose accumulations. There is a defined recording observer (the system or person responsible for recording the log, generally the system). A Biplane irradiation event will be recorded as two individual events, one for each plane. Accumulated values will be kept separate for each plane.

Type: Extensible
Order: Non-Significant
Root: Yes

</tbody>
</table>

Content Item Descriptions
"Projection X-Ray" refers to procedures performed on either integrated equipment (where information is passed between the X-Ray source (generator and tube), detector, and mechanical systems), or non-integrated equipment (where data might not be available for one or more components such as cassette-based systems). The data availability can be described in Rows 8, 9 and 10. The specific type of equipment can be described in Row 4.

The coded term for "Mammography" is intended to encompass all types of projection X-Ray imaging of the breast.

**Note**
Mammography exams are distinguished by a different value in this attribute, Angiography exams are distinguished by the Irradiation Event Type attribute = Fluoroscopy, CR/DR exams are distinguished by one or more of the Data Availability Flags = No, and CT exams are distinguished by the use of a different Template.

| Row 2 | The observer context may include both a Person Observer identification, as well as the identity of the equipment providing the values for the irradiation event (Device Observer identification), if not inherited. |
| Row 5 | A value of "No" indicates that details associated with the X-Ray Detector are not available to the device generating this report. For example, an X-Ray Source system might lack any communication with the associated cassette-based X-Ray detector or any method of entering such information. A value of "Yes" or the absence of this row means that the details are available. |
| Row 8 | A value of "No" indicates that details associated with the X-Ray Source are not available to the device generating this report. For example, a cassette-based X-Ray detector might lack any communication with the associated X-Ray Source or any method of entering such information. A value of "Yes" or the absence of this row means that the details are available. |
| Row 9 | A value of "No" indicates that details associated with the Gantry and/or Table are not available to the device generating this report. For example, a cassette-based X-Ray detector might lack any communication with the associated gantry/table or any method of entering such information. A value of "Yes" or the absence of this row means that the details are available. |
| Row 10 | Cassette-based X-Ray systems should consider themselves to be Single Plane systems. |
| Row 11 | Details of the underlying irradiation events. If Row 18 has a value of "MPPS Content" then a TID 10003 "Irradiation Event X-Ray Data" item may be generated for each item in the MPPS Exposure Dose Sequence (0040,030E), but since this is an optional element in MPPS, if it is absent, empty or incomplete, there may be no irradiation event level information available. Alternatively, the information may be copied or computed from the images. |
| Row 16 | The Dose Image references a graphic representation of the radiation dose distribution. This may be a Secondary Capture scan of a dosimetry film. |
| Row 17 | The physician responsible for determining that the irradiating procedure was appropriate for the indications. The value may come from Requesting Physician (0032,1032), Requesting Physician Identification Sequence (0032,1031) or somewhere else based on hospital policies. |
| Row 18 | The primary source of information from which this dose object was constructed. The Source of Dose Information (Row 18) is independent of the Scope Of Accumulation (Row 6); e.g., it would be typical to have a scope of (113016, DCM, "Performed Procedure Step"), but a source of (113856, DCM, "Automated Data Collection") rather than (113858, DCM, "MPPS Content"). |

**TID 10002 Accumulated X-Ray Dose**

This general Template provides detailed information on projection X-Ray dose value accumulations over several irradiation events from the same equipment (typically a study or a performed procedure step).

Content Item Descriptions

Row 5 | Date that the calibration of the equipment's dose indicators was performed

Row 6 | Typically a value provided by the medical physicist. The recorded dose or dose area product values in this report can be multiplied by this factor to obtain estimated real-world values.

Note

It is important that this value must not be applied to the measured values before storing them in the report.
Value range from 0 to 100 percent. Uncertainty of the 'actual' value expressed as +/- of the mean.

Identifies Individual or organization responsible for calibration

Describes calibration protocol according to equipment standards or local guidelines.

The device that produced the irradiation accumulated in this Template. I.e., the X-Ray source. This is not required to be present if the information is the same as that already recorded in TID 1004 “Device Observer Identifying Attributes” encoded via the inclusion of TID 1002 “Observer Context” in TID 10001 “Projection X-Ray Radiation Dose” Row 5, which in turn may be absent if identical to the content in the Enhanced General Equipment Module, or if more than one device produced the accumulated irradiation.

These coordinates relate a visible landmark on the X-Ray table to the Table Reference Point that is arbitrarily defined by the manufacturer and not necessarily visible to the operator.

The Equipment Landmark Y Position is not recorded since it is, by definition, in the plane of the table as is the origin of the Table Coordinate System so the value would always be zero.

In many instances, the values will be either:

- EV (128772, DCM, "Reference Basis") [1268] = (T-D1120, SRT, "Vertex of Head") with EV (128773, DCM, "Reference Geometry") [1268] = (128120, DCM, "Plane through Superior Extent") [1253], or

- EV (128772, DCM, "Reference Basis") [1268] = (T-D9700, SRT, "Foot") with EV (128773, DCM, "Reference Geometry") [1268] = (128121, DCM, "Plane through Inferior Extent") [1253]

This distance (likely recorded by the operator) locates the patient with respect to an X-Ray table landmark. The patient is assumed to be centered in the left-right axis of the X-Ray table.

### TID 10003 Irradiation Event X-Ray Data

This Template conveys the dose and equipment parameters of a single irradiation event.

The Template and requirements are structured to consider equipment with various levels of integration between the components (X-Ray Source, Plate or Detector, and Gantry/Table) of the equipment.

An irradiation event is the loading of X-Ray equipment caused by a single continuous actuation of the equipment's irradiation switch, from the start of the loading time of the first pulse until the loading time trailing edge of the final pulse. The irradiation event is the "smallest" information entity to be recorded in the realm of Radiation Dose reporting. Individual Irradiation Events are described by a set of accompanying physical parameters that are sufficient to understand the "quality" of irradiation that is being applied. This set of parameters may be different for the various types of equipment that are able to create irradiation events. Any automatic on-off switching of the irradiation source during the event shall not be treated as separate events, rather the event includes the time between start and stop of irradiation as triggered by the user. E.g., a pulsed fluoro X-Ray acquisition shall be treated as a single irradiation event.

As described in Section 6.2.4, measurement concepts may be post-coordinated, even though not explicitly specified in the Template. In particular, post-coordination using modifier concept (121401, DCM, "Derivation"), with modifier values drawn from CID 10009 “Measured/Calculated” would be appropriate to encode indications of measured or of calculated values.

**Content Item Descriptions**

If the image generating entity does not assign a DICOM UID to the irradiation event (e.g., for non-digital imaging equipment), the application generating this report shall assign a UID.

In the case of non-integrated cassette-based equipment, a standalone Detector will generate UIDs for the Events it observes. If the X-Ray Source component of the equipment also reports information, it too will generate UIDs for the Events it creates. A downstream system (e.g., a workstation or the Dose Information Reporter itself) may combine the two reports into a composite report, and match up the events based on details such as the time information, and use the UIDs of the X-Ray Source.
Row 6  The DateTime that the application of X-Rays started for this irradiation event. This shall correspond to the start of the first irradiation in the Irradiation Event, which defines the starting point for the calculation of Row 36 "Irradiation Duration".

Row 17  The target region is the anatomy exposed.

Row 17b  Previously, a CODE content item (T-D0005, SRT, "Anatomical structure") along with CODE concept modifier (G-C171, SRT, "Laterality") were used to identify bilateral anatomy. This duplicated the function of Row 17 and was retired. See PS3.16 2017c.

Row 21  A text definition of the Reference Point (RP) used for RP-related dose values.

Row 22  A coded definition of the Reference Point (RP) used for RP-related dose values.

Row 26  People responsible for the administration of the radiation reported in the irradiation event. May include values that would appear in Performing Physicians' Name (0008,1050), Performing Physician Identification Sequence (0008,1052), Operators' Name (0008,1070) and/or Operator Identification Sequence (0008,1072).

TID 10003A Irradiation Event X-Ray Detector Data

This Template contains data that is expected to be available to the X-Ray detector or plate reader component of the equipment.

### Content Item Descriptions

**Row 1**  
Dose applied by this irradiation event, relative to defined reference point.

**Row 7**  
If a precise count of pulses is not available, an estimated number shall be provided, and the Row 8 Concept Modifier shall indicate "Estimated".

**Row 9**  
Pulse width as measured/recorded by the system, either as a single total value, or as multiple values. If multiple values are provided, their number shall match the value in Row 7 "Number of Pulses".

**Row 11**  
KVP value as measured/recorded by system, either as a single mean value, or as multiple values. If multiple values are provided, their number shall match the value in Row 7 "Number of Pulses".

**Row 12**  
Tube current as measured/recorded by system, either as a single mean value, or as multiple values. If multiple values are provided, their number shall match the value in Row 7 "Number of Pulses".

**Row 14**  
Exposure time as measured/recorded by the system.

**Row 15**  
Exposure as measured/recorded by system, either as a single total value, or as multiple values. If multiple values are provided, their number shall match the value in Row 7 "Number of Pulses". The Exposure will be affected by the shape of the pulse and other factors, and may not be a simple multiplication of tube current and exposure time.

**Row 18**  
If one or more Filter(s) were applied during this irradiation event

**Row 23**  
Collimated area at the receptor plane.

**Row 27**  
The device that produced the irradiation in this Irradiation Event. I.e., the X-Ray source.

This is not required to be present if the information is the same as that already recorded in TID 1004 “Device Observer Identifying Attributes” encoded via the inclusion of TID 1002 “Observer Context” in TID 10001 “Projection X-Ray Radiation Dose” Row 5, which in turn may be absent if identical to the content in the Enhanced General Equipment Module.
TID 10003C Irradiation Event X-Ray Mechanical Data

This Template contains data that is expected to be available to the gantry or mechanical component of the equipment.

Content Item Descriptions

Row 2: Angle in patient's "equatorial" plane (LAO to RAO). For dynamically changing angle during the event, the start value shall be provided. Equivalent to (0018,1510) in an image instance.

Row 3: Angle in patient's "sagittal" plane (CRAN to CAUD). For dynamically changing angle during the event, the start value shall be provided. Equivalent to (0018,1511) in an image instance.

Row 4: In case of motion during irradiation event, Positioner Primary ending angle.

Row 5: In case of motion during irradiation event, Positioner Secondary ending angle.

Row 6: Column device Angle in equipment based coordinates.

Rows 12 to 20: Refer to the definitions of the X-Ray Isocenter Reference System ("X-Ray Isocenter Reference System Macro" in PS3.3).

TID 10004 Accumulated Fluoroscopy and Acquisition Projection X-Ray Dose

This general Template provides detailed information on projection X-Ray dose value accumulations over several irradiation events from the same equipment (typically a study or a performed procedure step).

CT Radiation Dose SR IOD Templates

The Templates that comprise the CT Radiation Dose SR are interconnected as in Figure A-15.

![Figure A-15. CT Radiation Dose SR IOD Template Structure](image)

TID 10011 CT Radiation Dose

This Template defines a container (the root) with subsidiary Content Items, each of which corresponds to a single CT X-Ray irradiation event entry. There is a defined recording observer (the system or person responsible for recording the log, generally the system). Accumulated values shall be kept for a whole Study or at least a part of a Study, if the Study is divided in the workflow of the examination, or a performed procedure step. Multiple CT Radiation Dose objects may be created for one Study.

**Content Item Descriptions**

**Row 4**
The observer context may include both a Person Observer identification, as well as the identity of the equipment providing the values for the irradiation event (Device Observer identification), if not inherited.

**Row 5**
Start, DateTime of the first CT Irradiation Event of the accumulation

**Row 6**
End, DateTime of the last CT Irradiation Event of the accumulation

**Row 12**
The physician responsible for determining that the irradiating procedure was appropriate for the indications. The value may come from Requesting Physician (0032,1032), Requesting Physician Identification Sequence (0032,1031) or somewhere else based on hospital policies.

**Row 13**
The primary source of information from which this dose object was constructed.

**TID 10012 CT Accumulated Dose Data**

This general Template provides detailed information on CT X-Ray dose value accumulations over several irradiation events from the same equipment and over the scope of accumulation specified for the report (typically a Study or a Performed Procedure Step).

### Content Item Descriptions

Rows 5, 6

Total Number of CT irradiation events.

A CT irradiation event is one continuous irradiation procedure and is defined through consistent acquisition parameters.

In the case of dose modulation the calculations are based on the effective parameters (e.g., the effective mA recorded in the Mean X-Ray Tube Current), and these acquisition parameters are consistent.

Rows 5, 6

The Dose Length Product (DLP) is calculated for every irradiation event. The Dose Length Product Total is the sum of the DLP values. The calculation is based on the CTDI<sub>vol</sub> result of each irradiation event.

Rows 5, 6

Effective dose (E, in units of mSv) evaluated as a total over the scope is defined in Row 6 of Template TID 10011 "CT Radiation Dose”.

Effective dose is defined by the reference in Rows 5 or 6 of this Template.

It may be calculated from a product of DLP and an ‘Effective Dose Conversion Factor’ (E/DLP). Or it may be calculated from a product of the Mean CTDIfreeair and the ratio E/CTDIfreeair. The ratios E/DLP or E/CTDIfreeair may be evaluated either from computer simulations applying Monte Carlo (MC) sampling techniques or from dosimetric measurements in an anthropomorphic phantom, e.g., the Alderson-Rando phantom. The specific method used is identified in Rows 7 through 11.
Reference of the base publication defining the Effective Dose, either as a coded value, or a textual bibliographic reference. ICRP Publications shall be referenced using their assigned coded values.

Description of the method used for Effective Dose evaluations.

Description of the reference-patient mathematical or computational model used when Effective Dose is derived via Monte Carlo simulations of radiation transport in such models. Examples of publications that specify particular reference patient models are NUREG/CR-1159, ORNL/NUREG/TM-367 (1980); NRPB-R186 (1985); GSF-Bericht S-885 (1986); Fill et al., Health Physics Vol. 86 (3): 253-272 (2004).

Description of the condition Effective Dose measured

Type of Effective Dose phantom used, e.g., Alderson-Rando

Type of dosimeter used, e.g., TLD (Thermo Luminescence Dosimeter)

The device that produced the irradiation accumulated in this Template. I.e., the CT Scanner. This is not required to be present if the information is the same as that already recorded in TID 1004 "Device Observer Identifying Attributes" encoded via the inclusion of TID 1002 "Observer Context" in TID 10011 "CT Radiation Dose" Row 4, which in turn may be absent if identical to the content in the Enhanced General Equipment Module, or if more than one device produced the accumulated irradiation.

TID 10013 CT Irradiation Event Data

This Template conveys the dose and equipment parameters of a single irradiation event.

A CT irradiation event is the loading of X-Ray equipment caused by a single continuous actuation of the equipment's irradiation switch, from the start of the loading time of the first pulse until the loading time trailing edge of the final pulse. Any on-off switching of the radiation source during the event shall not be treated as separate events; rather the event includes the time between start and stop of radiation as triggered by the user, e.g., a single sequence of scanning comprised of multiple slices acquired with successive tube rotations and table increments shall be treated as a single irradiation event. Depending on the examination workflow and the anatomical target region the CT irradiation event data may split into multiple instances of this Template for better dose estimation. The irradiation event is the "smallest" information entity to be recorded in the realm of Radiation Dose reporting. Individual Irradiation Events are described by a set of accompanying physical parameters that are sufficient to understand the "quality" of irradiation that is being applied. This set of parameters may be different for the various types of equipment that are able to create irradiation events.

**Content Item Descriptions**

**Row 2** User-defined type of clinical acquisition protocol for creating images or image-derived measurements. May be taken from Protocol Name (0018,1030) or from Performed Procedure Step Description (0040,0254).

**Row 3** The target region is the anatomy exposed.

**Row 4** Description of the method used during acquisition of this CT irradiation event, may be derived from Acquisition Type (0018,9302).

**Row 4b** Though not a characteristic of the acquisition per se, the type of reconstruction intended has a bearing on the technique used. If multiple types of reconstruction are performed, multiple values can be listed. These values should correspond to the values of Reconstruction Algorithm (0018,9315) in the reconstructed images.

**Row 5** The acquisition was performed with or without contrast medium application.

**Row 6d, 6e** If an acquisition is a repeat because an earlier acquisition was unsatisfactory, this may be recorded along with a coded reason. This is intended to help with subsequent analysis by providing a priori information about why the study might be flagged as an outlier with higher dose exposure values than usual for the type of study.

**Row 6f** The DateTime that the application of X-Rays started for this irradiation event. This shall correspond to the start of the first irradiation in the Irradiation Event, which defines the starting point for the calculation of the contents of the Row 21 "CT Dose" CONTAINER.

**Row 8** Total time the patient has received X-Ray exposure during the irradiation event.

**Row 10** The value of the nominal width (referenced to the location of the isocenter along the z axis) of a single collimated slice in mm.

**Row 11** The value of the nominal width (referenced to the location of the isocenter along the z axis) of the nominal total collimation in mm over the area of active X-Ray detection (z-coverage).

**Row 12** Pitch Factor: For Spiral Acquisition, the Pitch Factor is the ratio of the Table Feed per Rotation to the Nominal Total Collimation Width. For Sequenced Acquisition, the Pitch Factor is the ratio of the Table Feed per single sequenced scan to the Nominal Total Collimation Width.

**Row 14** CT X-Ray source parameters related to the acquisition. For each X-Ray source an item must be present. For multi-energy acquisitions, multiple items may be present for each X-Ray source, each item describing one energy level.

**Row 15** Identification of the X-Ray source. Identifies the particular X-Ray source (in a multi-source CT system) for which the set of X-Ray source parameter values is reported.

**Row 16** KVP value as measured/recorded by system.

**Row 18** Mean tube current as measured/recorded by system.

**Row 19** Exposure time as measured/recorded by the system per rotation.

<td>The CTDI&lt;sub&gt;free air&lt;/sub&gt; Calculation Factor is the CTDI&lt;sub&gt;free air&lt;/sub&gt; per mAs, expressed in units of mGy/mAs. The CTDI&lt;sub&gt;free air&lt;/sub&gt; Calculation Factor may be used in one method of calculating Dose. For example, for this acquisition, Effective Dose = Mean X-Ray Tube Current * Cumulative Exposure Time * CTDI&lt;sub&gt;free air&lt;/sub&gt; Calculation Factor * (Effective Dose / CTDI&lt;sub&gt;free air&lt;/sub&gt;).</td>
</tr>
<tr>
<td>Row 25</td>
<td>MeanCTDI&lt;sub&gt;free air&lt;/sub&gt; is the mean CTDI for this acquisition, evaluated free-in-air according to IEC 60601-2-44. MeanCTDI&lt;sub&gt;free air&lt;/sub&gt; = Mean X-Ray Tube Current * Cumulative Exposure Time * CTDI&lt;sub&gt;free air&lt;/sub&gt; Calculation Factor. The CTDI&lt;sub&gt;free air&lt;/sub&gt; may be used in one method of calculating Effective Dose.</td>
</tr>
<tr>
<td>Row 26</td>
<td>For Spiral scanning, DLP = CTDI&lt;sub&gt;vol&lt;/sub&gt; * Scanning Length. For Sequenced scanning, DLP = CTDI&lt;sub&gt;vol&lt;/sub&gt; * Nominal Total Collimation Width * Cumulative Exposure Time / Exposure Time per Rotation. For Stationary and Free scanning, DLP = CTDI&lt;sub&gt;vol&lt;/sub&gt; * Nominal Total Collimation Width (according to IEC 60601-2-44).</td>
</tr>
<tr>
<td>Row 27</td>
<td>Effective Dose in mSv of the single continuous time-frame of the irradiation computed as described in TID 10012 “CT Accumulated Dose Data”.</td>
</tr>
<tr>
<td>Row 29</td>
<td>The Effective Dose Conversion Factor is the ratio of the Effective Dose to the DLP, expressed in units of mSv/mGy.cm, and it is used as a factor in one method of estimating Effective Dose. Monte Carlo Simulations (or dosimetric measurements in an anthropomorphic phantom, e.g., the Alderson-Rando phantom) may be used as a basis for the evaluation of Effective Dose Conversion Factors.</td>
</tr>
<tr>
<td>Row 30</td>
<td>More than one Size Specific Dose Estimation may be included, for example if different computation methods are used.</td>
</tr>
<tr>
<td>Row 31</td>
<td>The methods of [AAPM Report 204] are listed in CID 10023 “Size Specific Dose Estimation Method for CT”; other methods may be used. The phantom size (16cm or 32cm) used for the calculation is available from the phantom type defined in Row 23.</td>
</tr>
<tr>
<td>Row 32</td>
<td>The condition specifies inclusion of the Measured Lateral Dimension if it was used in the calculation.</td>
</tr>
<tr>
<td>Row 33</td>
<td>The condition specifies inclusion of the Measured AP Dimension if it was used in the calculation.</td>
</tr>
<tr>
<td>Row 34</td>
<td>The Derived Effective Diameter is conditionally included, whether it was derived from measurements or estimated from age, but may not be used for other (non-AAPM Report 204) methods.</td>
</tr>
</tbody>
</table>
A single value for Water Equivalent Diameter is encoded in Row 34b if the method uses a single value. It is required if the method uses a representative slice, but may also be present if the method used a Localizer or Raw Data at a single location rather than the entire scan range.

The modifier is intended to specify the family of methods and not the specific technique (e.g., for AAPM 220 (113987, DCM, "AAPM 220") is used, not (113981, DCM, "Water Equivalent Diameter Representative Value"), etc.).

If the method uses multiple slices across the scan range, the reconstructed image Series or (list of) Instances used is referenced; the values for Water Equivalent Diameter may or may not be recorded in the CT Image Module or CT Exposure Macro of those images. More than one Series may be referenced if the reconstructed images for this acquisition used for Water Equivalent Diameter estimation span multiple series.

If the Water Equivalent Diameter was computed from raw views rather than reconstructed images, then the Raw Data is referenced, if it was encoded in DICOM (it is not required to be).

This location is patient (not table or gantry) relative, to allow it to be defined in the Patient Coordinate System and hence related to the Image Position (Patient) in the reconstructed images (see TID 10014 “Scanning Length”, included at Row 9). It is required if the method uses a representative slice, but may also be present if the method used a Localizer or Raw Data at a single location rather than the entire scan range.

Record of details associated with using the NEMA Dose Check Standard (NEMA XR-25-2010).

The type of exposure modulation. May use the value of Exposure Modulation Type (0018,9323) from CT Exposure Macro or from CT Image Module.

People responsible for the administration of the radiation reported in the irradiation event. May include values that would appear in Performing Physicians' Name (0008,1050), Performing Physician Identification Sequence (0008,1052), Operators' Name (0008,1070) and/or Operator Identification Sequence (0008,1072).

The device that produced the irradiation in this Irradiation Event. I.e., the CT scanner. This is not required to be present if the information is the same as that already recorded in the TID 1004 “Device Observer Identifying Attributes” encoded via the inclusion of TID 1002 “Observer Context” in TID 10011 “CT Radiation Dose” Row 4, which in turn may be absent if identical to the content in the Enhanced General Equipment Module.

</tbody>
</table>

**Content Item Descriptions**

**Row 1**
- For Spiral scanning, the scanning length is normally the table travel in mm during the tube loading (see Figure A-16).
- For Sequenced scanning, the scanning length is the table travel between consecutive scans times the number of scans.
- For Stationary and Free scanning, the scanning length is the nominal width of the total collimation.

**Row 2**
- The length of the reconstructable volume is the maximum z-range between the outermost edges of the top and bottom slices that can be reconstructed from the acquisition.
- For Spiral scanning, the length of reconstructable volume is the z-range between the outermost beginning of the first reconstructable slice and the outermost end of the last reconstructable slice (see Figure A-16).
- For Sequenced scanning, the length of reconstructable volume is the z-range between the outermost beginning of the first slice and the outermost end of the last slice (i.e., including any skip).
- For Stationary and Free scanning, the length of reconstructable volume is the nominal width of the total collimation.

**Row 3**
- For Spiral scanning, the exposed range is as defined in IEC 60601-2-44 (Ed. 3) 302.115(b) (see Figure A-16).
- Exposed range is not defined for other modes of scanning.

**Rows 4-5**
- The Top and Bottom Z Locations of the Reconstructable Volume are independent of the slice width of any actual reconstructed slices. They are measured from the edges of the volume, and hence are not equal to the Z locations encoded in the images of any actual reconstructed slices, which are recorded as the center of the slice.

**Rows 4-7**
- These locations are patient (not table or gantry) relative, to allow them to be defined in the Patient Coordinate System and hence related to the Image Position (Patient) in the reconstructed images. They are also defined in terms of the top (towards the patient's head), and bottom (towards the patient's feet) of the corresponding ranges, in order to make them independent of whether the scan starts at the top or the bottom or shuttles back and forth in between (see Figure A-16).
### Figure A-16. Spiral Acquisition Parameters

#### TID 10015 CT Dose Check Details

This Template records details related to the use of the NEMA Dose Check Standard (NEMA XR-25-2010).

**Radiopharmaceutical Radiation Dose SR IOD Templates**

The Templates that comprise the Radiopharmaceutical Radiation Dose SR are interconnected as in Figure A-17.

![Figure A-17. Radiopharmaceutical Radiation Dose SR IOD Template Structure](image-url)
**TID 10021 Radiopharmaceutical Radiation Dose**

This Template defines a container (the root) with subsidiary Content Items, each of which corresponds to a single Radiopharmaceutical Administration Dose event entry. There is a defined recording observer (the system and/or person responsible for recording the assay of the radiopharmaceutical, and the person administered the radiopharmaceutical). Multiple Radiopharmaceutical Radiation Dose objects may be created for one study. Radiopharmaceutical Start DateTime in TID 10022 “Radiopharmaceutical Administration Event Data” will convey the order of administrations.

**Content Item Descriptions**

Row 4  The value of Half-life that was used for computing the decay of the administered radiopharmaceutical. It is not intended for use by the receiver for any further computation.

Row 5  Activity per unit mass of the radiopharmaceutical at Radiopharmaceutical Start Time

Row 6  Unique identification of a single radiopharmaceutical administration event.

Row 8  The estimated percentage of administered activity lost at the injection site. The estimation includes extravasation, paravenous administration and leakage at the injection site.

Row 9  The time the radiopharmaceutical was administered to the patient for imaging purposes.
Row 11 | Total amount of radioactivity administered to the patient at Radiopharmaceutical Start Time. It is a computed field from TID 10022 Pre-Administration Measured Activity Row 13, TID 10022 Post-Administration Measured Activity Row 17, Radionuclide Half Life Row 4 and Radiopharmaceutical Start Time Row 9. Does not include estimated extravasation activity.

Rows 13, 16 | Observation DateTime (0040,A032) shall be used to record when the measurement was taken.

Row 23 | Identifies the person administering the product.

Row 24 | The billing codes for the preparation and administration of the radiopharmaceutical. It does not include performance and interpretation of the imaging.

Row 25 | Registered drug establishment code for the product. A coding scheme example is NDC, WHO-DDE or RxNorm. Multiple entries can be used for equivalent drug product codes.

Row 27 | The human readable identification of the specific radiopharmaceutical quantity (dose) administered to the patient.

Row 28 | Identifies the vial, batch or lot number from which the individual radiopharmaceutical quantity (dose) was produced. Row 27 the Radiopharmaceutical Identifier records the identification for each individual dose.

Row 29 | Identifies the lot or unit serial number for the reagent component for the radiopharmaceutical identified in row 27.

Row 30 | Identifies the lot or unit serial number for the radionuclide component for the radiopharmaceutical identified in row 27.

**TID 10023 Organ Dose**

This Template conveys the information about the dose to a single organ.

</table>
For paired organs, use (G-A102, SRT, "Right and Left") to report the estimated absorbed dose for both organs.

The estimated mass of organ in grams used when calculating the organ dose.

Method used to obtain the estimate. This could include a method that does not involve performing a measurement (e.g., Standard Organ Mass Tables).

Organ dose (in units of mGy). Organ is specified by row 2.

**TID 10024 Radiopharmaceutical Administration Patient Characteristics**

This Template describes the characteristics of the patient that are specific to the current clinical presentation (visit). The characteristics noted may affect the activity received, and how dose is calculated for the patient. Patient Characteristic concepts in this Template, which may replicate attributes in the Patient Study Module, are included here as possible targets of by-reference relationships from other Content Items in the SR tree.

### Content Item Descriptions

**Row 3**  
Identify all observers and devices involved with creating the organ estimations included in this Patient Radiation Dose SR.

TID 10031 Radiation Dose Estimate

The dose estimate is used to record the results from one analysis method from one or more radiation sources. Organ dose estimates are calculated from one or more irradiation events to a patient. The output from one or more sources of radiation can be used separately or combined to estimate the dose to a patient or individual organs.

**Type:** Extensible  
**Order:** Non-Significant  
**Root:** No

### Content Item Descriptions

Row 13  
Equivalent Dose is an international quantity and includes the use of a Radiation Weighting Factor to compensate for the radiation type, e.g., photon, neutron, alpha or beta particle, etc. Stating equivalent dose is not recommended in almost all dosimetry situations, except in Radiopharmaceutical dose. This is not Effective Dose.

### TID 10032 Radiation Dose Estimate Representation

Different representations (e.g., images) of the distribution of absorbed energy allow a better understanding of how this energy may affect tissue.

**Type:** Extensible  
**Order:** Non-Significant  
**Root:** No

Content Item Descriptions

Row 2: Reference to Radiation Dose SRs or Radiopharmaceutical Administration Dose SRs used in the dose estimation. At least one such SR shall be referenced.

Note
If an SR does not exist, one must be created from estimated data.

Row 3: Reference to Fiducial SOP Instance that is used to register the Frame of Reference of the Radiation Dose SR.

Row 4: Reference to Irradiation Event UIDs or Radiopharmaceutical Event UIDs used in the Radiation Dose Estimate Methodology. This shall not be present if all events in the SR are used.

Rows 8 and 9: Reference to an instance that contains the model used when determining the radiation transport and deposition of energy within a patient, e.g., Surface Segmentation, Mesh, Parametric Map, etc.

Row 10: Reference to the series of images that contains the model used when determining the radiation transport and deposition of energy within a patient, e.g., CT, MRI, etc.

Row 11: Reference to Publication describing the model used. If proprietary, reference the manufacturer model and version of software used.

Rows 13-20: Provide the demographics used in the patient model to estimate dose. These are not necessarily the demographics of the actual patient.

Row 21: Contains the Spatial Registration from each Source Radiation Dose SR Frame of Reference to the patient model Frame of Reference.

The Frame of Reference of patient model is defined by the space of model coordinates. The Frame of Reference of the Source Radiation Dose SR is the Frame of Reference of the acquired patient images. If no Frame of Reference of the acquired patient images exists, fiducials can be used to define Frame of Reference in both the equipment space, i.e., Source Radiation Dose SR, and the Patient Model space and referenced in Row 5.

If RCS Registration Method Type is Visual Alignment, it is assumed any translation/rotation information from the visual alignment is added to other alignment translation/rotation information and saved as a single Spatial Registration SOP Instance.

Row 25: One content item per attenuator. This can be information about materials in the radiation beam that is used in the estimation method and that may or may not have been included in the Radiation Dose SR. If the beam Attenuator (e.g., filter) is included here and is also in the Radiation Dose SR it is assumed additional information relative to the beam Attenuator material, shape, size, location was needed and this information was not in the Radiation Dose SR or the Radiation Dose SR information is considered incorrect or incomplete.
Row 27 The estimation method may use an equivalent material rather than the actual material, e.g., a plastic table may be use equivalent aluminum attenuation.

Row 28 If the attenuator is not uniform, a thickness may still be provided and it is expected that Row 29 (Attenuator Description) will clarify how that thickness was determined.

The specified equivalent material is identified in Row 27.

Row 29 The attenuator characteristics may be described here. If the attenuator thickness was not provided in Row 28, the attenuator may still be described.

Row 30 Complex attenuators are best described by a model.

Rows 33 and 34 Reference to an Instance that contains the model e.g., Surface Segmentation, Mesh, Parametric Map, etc.

Row 35 Reference to the Series of Images that contains the model, e.g., CT, MRI, etc. This can be a Spatial Fiducials SOP Instance.

Row 36 Contains the Spatial Registration from each Source Radiation Dose SR Frame of Reference to the X-Ray attenuator model Frame of Reference.

The Frame of Reference of the X-Ray attenuator model is defined by the space of model coordinates. The Frame of Reference of the Source Radiation Dose SR is the Frame of Reference of the acquired patient images. If no Frame of Reference of the acquired patient images exists, fiducials can be used to define Frame of Reference in both the equipment space, i.e., Source Radiation Dose SR, and X-Ray attenuator model space and referenced in Row 30.

If RCS Registration Method Type is Visual Alignment it is assumed any translation/rotation information from the visual alignment is added to other alignment translation/rotation information and saved as a single Spatial Registration SOP Instance.

Row 32 and 43 Provide name of method, reference to a publication or the manufacturer model and version

**TID 10034 Radiation Dose Estimate Parameters**

This template includes the parameters that are specific to the Radiation Dose Estimate Method used in the algorithms when estimating dose to individual organs, phantoms, or the entire body from imaging studies that use ionizing radiation.

**Type:** Extensible  
**Order:** Non-Significant  
**Root:** No

- Standard -
Note

In a prior version of this Context Group, the codes G-A11A, G-A11B, G-A12A, G-A16A, G-A16B, G-A16C, and G-A16D were specified for various concepts. The use of some of those codes conflicts with their assignment to other concepts in SNOMED, and their use in this context is deprecated. Although there is minimal possibility of misinterpretation with SOP Instances that may include the deprecated use, receiving applications should be aware of this change; see Annex J.

Note

In a prior version of this table, the code G-A11B was specified for the concept Parasagittal. The use of this code conflicts with its assignment to another concept in SNOMED, and its use in this context is deprecated. Although there is minimal possibility of misinterpretation with SOP Instances that may include the deprecated use, receiving applications should be aware of this change; see Annex J.

<tr>
<td>SRT</td>
<td>F-10460</td>
<td>semi-erect</td>
<td>102539006</td>
<td>C0522018</td>
</tr>
</tbody>
</table>

Note

1. The use of this Context Group in the Patient Orientation Code Sequence (0054,0410) of the “Nuclear Medicine Image IOD” in PS3.3 and the “Positron Emission Tomography Image IOD” in PS3.3 requires a Coding Scheme Designator value of "99SDM".

2. In a prior version of this Context Group (F-10440, SRT, "Upright body position (finding)") was specified for the concept "erect" but has been inactivated as being ambiguous, with no suitable replacement. Accordingly the NCit concept of "upright" defined as "in a vertical position or posture" is used as a replacement.

<td></td>
<td></td>
</tr>
</tbody>
</table>

Note

1. The use of this Context Group in the Patient Orientation Modifier Code Sequence (0054,0412) of the "Nuclear Medicine Image IOD" in PS3.3 and the "Positron Emission Tomography Image IOD" in PS3.3 requires a Coding Scheme Designator value of "99SDM".

2. In a prior version of this Context Group, the codes G-5190 and G-5191 were specified for the concepts "headfirst" and "feet-first". The use of these codes is deprecated as they are not actually in SNOMED. Although there is minimal possibility of misinterpretation with SOP Instances that may include the deprecated use, receiving applications should be aware of this change; see Annex J.
3. For devices that do not have a conventional gantry geometry, the vendor of that device may describe in the Conformance Statement how the codes are interpreted with respect to the device geometry.

4. (126830, DCM, "left first"), (126831, DCM, "right first"), (126832, DCM, "posterior first") and (126833, DCM, "anterior first") are more specific than (R-10515, SRT, "transverse") in that they specify which side of the patient is towards the front of the equipment.

5. For quadrupeds, separate concepts for ventral and dorsal are not introduced, rather it is expected that anterior and posterior will be considered synonymous as they are when applied to the trunk.

</tr>
</tbody>
</table>

Note

1. In a prior version of this table, the code G-A117 was specified for the concept Transaxial, and R-11300 was specified for the concept Transverse. Since these concepts are synonymous in nuclear projections, and since SNOMED assigns G-A117 to the concept Transverse, the use of R-11300 is deprecated. Although there is minimal possibility of misinterpretation with SOP Instances that may include the deprecated use, receiving applications should be aware of this change; see Annex J.

2. The following Code Values were formerly included in CID 26 “Nuclear Medicine Projections” and are retired:

<table>

CID 29 Acquisition Modality

This Context Group includes codes that may be used to identify an image or waveform acquisition modality, as used in Attribute Modality (0008,0060) of a Modality Worklist Scheduled Procedure Step or a Composite SOP Instance (see PS3.3). It generally corresponds to a class of diagnostic equipment, or to a specific acquisition function or technique in a device. This Context Group may be used as the value set for HL7 v2 Table 0259 (see HL7 v2.6 Chapter 8 Section 8.8.8.47).

Note

This Context Group is not the complete set of codes that may appear in the Attribute Modality (0008,0060); these are only the codes associated with orderable acquisition processes (not post-processing).

</tbody>
</table>

### Note

The formulas for the determination of SUVbw, SUVbsa, SUVlbm (James) and SUVibw are defined in Sugawara et al. *Reevaluation of the Standardized Uptake Value for FDG: Variations with Body Weight and Methods for Correction*. Radiology, 1999 at http://radiology.rsna.org/content/213/2/521.

The Janmahasatian LBM formula is defined in *Janmahasatian et al. Quantification of Lean Bodyweight. Clin Pharmacokinet. 2005 Oct 1;44(10):1051-65*. at http://dx.doi.org/10.2165/00003088-200544100-00004 and its role in SUVlbm(Janma) calculation is discussed in Tahari et al. *Optimum Lean Body Formulation for Correction of Standardized Uptake Value in PET Imaging. Journal of Nuclear Medicine*. 2014 Sep 1;55(9):1481-4. at http://jnmt.snmjournals.org/content/55/9/1481. The patient size correction factors are summarized here, where weight is in kg and height is in cm:

- SUVbw: males & females: weight
  - SUVlbm (James): males : 1.10 * weight - 120 * (weight/height) ^2
  - SUVlbm (James): females: 1.07 * weight - 148 * (weight/height) ^2
  - SUVlbm(Janma): males: 9.27E3 * weight / (6.68E3 + 216 * weight / (height^2))
  - SUVlbm(Janma): females: 9.27E3 * weight / (8.78E3 + 244 * weight / (height^2))
- SUVbsa: males & females: weight^0.425 * height^0.725 * 0.007184
- SUVibw: males: 48.0 + 1.06 * (height - 152)
females: 45.5 + 0.91 * (height - 152)

</table>

**Note**

This context group is intended for use rather than CID 230 "Yes-No" when the value (R-0038A, SRT, "Undetermined") is not permissible.

### CID 240 Present-Absent

**Resources:** HTML | FHIR JSON | FHIR XML | IHE SVS XML  
**Type:** Non-Extensible  
**Version:** 20170914  
**UID:** 1.2.840.10008.6.1.35

**Note**

In a previous version of this Context Group (R-40271, SRT, "Findings values") was used incorrectly to mean "Presence Undetermined"; there is no SNOMED CT concept that specifically means that the "presence" (of a finding) is undetermined, so the more general "undetermined" concept is used.

### CID 241 Present-Absent Only

**Resources:** HTML | FHIR JSON | FHIR XML | IHE SVS XML  
**Type:** Non-Extensible  
**Version:** 20151110  
**UID:** 1.2.840.10008.6.1.1113

</tr>
<tr>
<td>SRT</td>
<td>R-305D3</td>
<td>Isolation room</td>
<td>409688003</td>
<td>C1443994</td>
</tr>
</tbody>
</table>

Note

1. Only rooms appropriate for animals in the context of in vivo imaging are described (e.g., not necropsy rooms, etc.)
2. (R-305C3, SRT, "Recovery room" (synonym of "postoperative anesthesia care unit ") is reused here even though its parent is "Location within hospital premises (environment)", which is arguably specifically human. The same is true for (R-305D6, SRT, "Induction room") and (R-305D3, SRT, "Isolation room").

<td>Extensible</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Version:</td>
<td>20151110</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>UID:</td>
<td>1.2.840.10008.6.1.1073</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table CID 608. Animal Feed Sources

<table>
<thead>
<tr>
<th>Coding Scheme</th>
<th>Code Value</th>
<th>Code Meaning</th>
<th>SNOMED-CT Concept ID</th>
<th>UMLS Concept Unique ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>UMLS</td>
<td>C1547887</td>
<td>Commercial product</td>
<td></td>
<td>C1547887</td>
</tr>
<tr>
<td>DCM</td>
<td>127390</td>
<td>Locally manufactured product</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note

(C1547887, UMLS, "Commercial product") originates from the HL7 V2.5 Chapter 04 blood products description as an attribute name rather than a value, but in UMLS is not expressly constrained and has as a parent generic semantic type of "Manufactured Object".

CID 609 Animal Feeding Methods

Resources: HTML | FHIR JSON | FHIR XML | IHE SVS XML
Type: Extensible
Version: 20151110
UID: 1.2.840.10008.6.1.1074

Table CID 609. Animal Feeding Methods

<table>
<thead>
<tr>
<th>Coding Scheme Designator</th>
<th>Code Value</th>
<th>Code Meaning</th>
<th>SNOMED-CT Concept ID</th>
<th>UMLS Concept Unique ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>NCIt</td>
<td>C64636</td>
<td>ad libitum</td>
<td></td>
<td>C1879743</td>

<td>Food treat</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SRT</td>
<td>PA-00620</td>
<td>Gavage</td>
<td>61420007</td>
<td>C0041281</td>
</tr>
</tbody>
</table>

Note

(C0425422, UMLS, "Restricted diet") corresponds to the inactive SNOMED concept of "Dietary restriction NOS"; SNOMED currently does not seem to have an active generic concept of a restricted diet, as opposed to many specific types of restricted diet. In this context, the intent is to convey that the diet is controlled and restricted to finite quantities (e.g., as opposed to ad libitum) without requiring a detailed classification of what components are restricted.

CID 610 Water Types

Resources: HTML | FHIR JSON | FHIR XML | IHE SVS XML

<tr>
<td>SRT</td>
<td>P1-C0030</td>
<td>Inhalation anesthesia system closed no rebreathing primary agent</td>
<td>44812007</td>
<td>C0198796</td>
</tr>
</tbody>
</table>

Note

This context group contains SNOMED procedure code equivalents of enumerated string concepts for the [AQI Schema] element AnesthesiaMaintenanceCodeType. See http://www.aqihq.org/aqischdoc/AnesthesiaMaintenanceCodeType.html.
The AQI value "circle system" corresponds to (P1-C0020, SRT, "Inhalation anesthesia system closed rebreathing primary agent"). The SNOMED code meaning has been abbreviated to fit within the allowed DICOM Value Representation.

The AQI value "non-rebreathing" corresponds to (P1-C0030, SRT, "Inhalation anesthesia system closed no rebreathing primary agent"). The SNOMED code meaning has been abbreviated to fit within the allowed DICOM Value Representation.

Note

This context group contains SNOMED substance or product code equivalents of enumerated string concepts for the [AQI Schema] element MedicationTypeCodeType. See http://www.aqihq.org/aqischdoc/MedicationTypeCodeType.html and http://www.aqihq.org/aqischdoc/MedicationTypeCodeTypeExampleList.html.

The AQI value "ABX-Miscellaneous" corresponds to (C-5008C, SRT, "Antibiotic") product, since there is no substance code in SNOMED.

The AQI value "Vasopressor" corresponds to (F-619AA, SRT, "Vasoconstrictor").

No equivalent concepts are included for MedicationTypeCodeType values of NonFormulary antibiotic, Dye, Indigo Carmine Red, and Non-Formulary.

**Note:**

In this context group, SNOMED substance codes are used in preference to product codes, since there is no need to refer to specific products or preparations. SNOMED codes are used in preference to other potential sources of pharmaceutical related codes, such as from the National Drug Code (NDC) directory.

</tr>
<tr>
<td>SRT</td>
<td>F-61BD0</td>
<td>Lidocaine</td>
<td>387480006</td>
<td>C0023660</td>
</tr>
</tbody>
</table>

Note

- In this context group, SNOMED substance codes are used in preference to product codes, since there is no need to refer to specific products or preparations. SNOMED codes are used in preference to other potential sources of pharmaceutical related codes, such as from the National Drug Code (NDC) directory.

- For Lidocaine + Prilocaine, since it is a mixture of two substances, the code for the product concept is used. The code for a mixture of unspecified type is used, rather than a more specific code, e.g., for the so-called "Eutectic Mixture of Local Anesthetics (EMLA)", which consists of Lidocaine + Prilocaine. UMLS contains three distinct concepts, (C0059079, UMLS, "EMLA"), (C0617623, UMLS, "Lidocaine/Prilocaine") and (C0950567, UMLS, "Eutectic Lidocaine-Prilocaine").

</tr>
<tr>
<td>SRT</td>
<td>R-422A4</td>
<td>After procedure</td>
<td>303110006</td>
<td>C0580203</td>
</tr>
</tbody>
</table>

**Note**

The concepts used in this context group are more general than those for a specific procedure, e.g., surgery, radiotherapy, chemotherapy. In SNOMED, the concepts used in this context group are the parent concepts of the surgically-specific concepts used in CID 631 “Phase of Procedure Requiring Anesthesia”. There are no concepts defined specifically for periods related to an imaging procedure so the general concepts suffice (in context).

<td></td>
<td>C0039810</td>
</tr>
<tr>
<td>DCM</td>
<td>127240</td>
<td>Carrier temperature sensor</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note

(C0039810, UMLS, "Thermography") is a general concept that also encompasses diagnostic uses of thermography, in addition to simple temperature measurement; only the latter meaning is used here, as is implicit from the context of invocation.

CID 637 Exogenous Substance Types

Resources: HTML | FHIR JSON | FHIR XML | IHE SVS XML
Type: Extensible
Version: 20151110
UID: 1.2.840.10008.6.1.1102

Table CID 637. Exogenous Substance Types

<table>
<thead>
<tr>
<th>Coding Scheme</th>
<th>Code Value</th>
<th>Code Meaning</th>
<th>SNOMED-CT Concept ID</th>
<th>UMLS Concept Unique ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>SRT</td>
<td>G-C1F9</td>
<td>Graft material</td>
<td>246345001</td>
<td>C0181074</td>
</tr>
<tr>
<td>DCM</td>
<td>127460</td>
<td>Tumor Graft</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SRT</td>
<td>T-1A080</td>

</tr>
<tr>
<td>SRT</td>
<td>C-00224</td>
<td>Toxin</td>
<td>80917008</td>
<td>C0040549</td>
</tr>
</tbody>
</table>
Note

The specific concept (C22490, NCIt, "Tumor Cell Graft") (UMLS:C1519674) is not used, since grafts may not be cell suspensions, but rather entire tumors, fragments of tumor tissue, etc. Whether the graft is a xenograft or homograft is not specified, and may be encoded elsewhere (e.g., by encoding the species of origin). The non-tumor specific concept (G-C1F9, SRT, "Graft material") may be used when the graft is not a tumor (though strictly speaking, it is a SNOMED attribute rather than substance; UMLS:C0181074 does not make such a distinction).

<td>C0203309</td>
</tr>
</tbody>
</table>
Note

1. The inconsistent pattern of modality and anatomy in the code meaning is present in the source coding scheme (e.g., "Whole body CT" versus "PET whole body"), and not changed, except where necessary (e.g., (42175-0, LN, "Radionuclide scan of whole body") is actually just "scan of whole body" in the source scheme, which is insufficient, so "radionuclide" has been added).

2. The UMLS codes that map to the SNOMED concepts, when present, are shown, in the cases when UMLS is lacking a mapping between the LOINC and SNOMED codes. E.g., (44138-6, LN, "Brain PET") maps directly to (C1715408, UMLS, "Multisection:Find:Pt:Brain:Doc:Radnuc.PET"), but (P5-0A001, SRT, "PET Brain Study") maps to (C0412493, UMLS, "PET Brain Study"), which is used instead. In general, UMLS does not unify the mappings from LOINC and SNOMED, presumably due to the lexical dissimilarity of the terms (i.e., the LOINC mapping seems to be based on the fully-specified name rather than the long common name).

CID 647 Position Reference Indicator for Frame of Reference

<table>
<thead>
<tr>
<th>Coding Scheme Designator</th>
<th>Code Value</th>
<th>Code Meaning</th>
<th>SNOMED-CT Concept ID</th>
<th>UMLS Concept Unique ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>FMA</td>
<td>264776</td>

</table>
CID 1010 Reference Geometry - Planes

The items in this context group identify a specific plane associated with a reference basis (see CID 1000 "CT Transverse Plane Reference Basis"). The plane is defined by the intersection of the scan plane with the specified extent of the reference basis.

Note

1. A prior version of this context group used codes from the SCP-ECG vocabulary.

2. In a prior version of this table, the code 2:26 was specified for the concept Chest lead and the code 2:19 was specified for the concept Chest-manubrium lead per V5 placement.

Note

In a prior version of this Context Group the code T-48500 rather than T-48581 was defined for the concept Pulmonary Vein; this was inconsistent with the DICOM approach of selecting the "structure of" rather than "entire" concept. Although there is minimal possibility of misinterpretation with SOP Instances that may include the deprecated use, receiving applications should be aware of this change; see Annex J.

Include CID 3202 “Chest Pain”

CID 3227 QTc Measurements

This Context Group include both global and per lead corrected QT measurements specified in the ISO/IEEE 11073-10102 MDC nomenclature. Note that the MDC code for the per lead measurement is a base code for post-coordination with separately encoded lead identifiers. MDC also defines pre-coordinated codes that include both the measurement and the lead, which may be used in the same context as this Context Group; see the ISO/IEEE Standard.

While this Context Group includes distinct codes for the various QT correction algorithms, Templates using this Context Group may allow post-coordination using the QTc algorithm codes of CID 3678 “QT Correction Algorithms”.

CID 3228 ECG Timing Measurements

This Context Group include both global and per lead ECG measurements specified in the ISO/IEEE 11073-10102 MDC nomenclature. Note that the MDC codes for "per lead" measurements are base codes for post-coordination with separately encoded lead identifiers. MDC also defines pre-coordinated codes that include both the measurement and the lead, which may be used in the same context as this Context Group; see the ISO/IEEE Standard.

CID 3335 ECG Annotations

This Context Group comprises the nomenclature of ISO/IEEE 11073-10102, limited to the hierarchies under Reference IDs MDC_ECG_WAVEC, MDC_ECG_WAVEP, MDC_ECG_BEAT, and MDC_ECG_NOISE.

The base terms from those hierarchies are included in the table below for reference. Note that these base terms are pre-coordinated with a variety of concept discriminators, and the code values for those pre-coordinated terms are arithmetically derived from the code values of the base terms. For the complete current list of terms and discriminator values, see the ISO/IEEE Standard. All pre-coordinated terms (annotation plus discriminators) within the identified hierarchies are part of this Context Group.
Note

1. This Context Group is used in the Concept Name Code Sequence of the Waveform Annotation Sequence (0040,B020). See PS3.3.

2. A prior version of this context group used codes from the SCP-ECG coding system.

CID 3415 Cardiac Rhythms

This Context Group comprises the ECG rhythm annotations of ISO/IEEE 11073-10102. The terms included in the table below may not constitute the complete list; see the ISO/IEEE Standard.

Note

Note

In a prior version of this context group, Transthoracic echocardiography was assigned the code P5-B3003 and Epicardial echocardiography was assigned the code P5-B3004; these codes conflict with other SNOMED code assignments. Receiving applications should be aware of this change, and the possibility of misinterpretation of SOP Instances that may include the deprecated codes; see Annex J.

</tbody>
</table>

Table CID 3487. Intravascular Volumetric Regions

Note
(M-01000, SRT, "Morphologically Abnormal Structure") was previously described with a Code Meaning of "Lesion", but that synonym has been retired as "inappropriate" in SNOMED. The Code Meaning has been replaced with the preferred SNOMED term, and the separate concept (M-01100, SRT, "Lesion") added.

CID 3488 Min/Max/Mean

This context group contains modifiers that indicate whether the measurement is a minimum, maximum or averaged value.

Resources: HTML | FHIR JSON | FHIR XML | IHE SVS XML
Type: Extensible
Version: 20040614
UID: 1.2.840.10008.6.1.123

**CID 3493 IVUS Relative Stenosis Severities**

This context group is a set of stenosis severity classifications for multiple lesions within a segment. There will always be a worst stenosis (T-1), the stenosis with the smallest lumen size.

There can be multiple secondary stenoses (T-2, T-3, etc.), which are lesions meeting the definition of a stenosis, but with lumen sizes larger than the worst stenosis. Reference "American College of Cardiology Clinical Expert Consensus Document on Standards for Acquisition, Measurement and Reporting of Intravascular Ultrasound Studies (IVUS) ".

Note

In a prior version of this Context Group the code T-48500 rather than T-48581 was defined for the concept Pulmonary Vein; this was inconsistent with the DICOM approach of selecting the "structure of" rather than "entire" concept. Although there is minimal possibility of misinterpretation with SOP Instances that may include the deprecated use, receiving applications should be aware of this change; see Annex J.

CID 3629 Procedure Intent

This Context Group specifies the intent for a procedure or a procedure step, depending on the context of invocation. The intent for a procedure step may be different than that of the procedure in which it occurs.

Note
1. For example, a surgical biopsy procedure may have "Diagnostic Intent", while the imaging procedure step within that procedure may have "Guidance Intent".
2. Collection of specimens is generally "Diagnostic Intent"; "Forensic Intent" is typically used for autopsies; "Palliative Intent" and "Adjuvant Intent" may apply to certain radiotherapy procedures.
3. In SNOMED-CT, "Staging Intent" is a subsidiary concept (refinement) of "Diagnostic Intent". The following are subsidiary concepts of "Therapeutic Intent": Adjunct, Adjuvant, Curative, Neo-adjuvant, Prophylactic, and Supportive. Prophylactic is also a subsidiary concept of Preventive intent.

CID 3672 Pacemakers

This Context Group includes the full set of codes for types of pacemakers specified in the NASPE/BPEG Generic Pacemaker Code (NBG). The Coding Scheme Designator (0008,0102) shall be NBG.

Note
1. A prior version of this context group used codes from the SCP-ECG vocabulary.
Further information at http://www.hrsonline.org/Practice-Guidance/Clinical-Guidelines-Documents/2002-The-Revised-NASPE-BPEG-Generic-Code-for-Antibradycardia-AdaptiveRate-and-Multisite-Pacing. For reference, the scheme is reproduced here:

**CID 3681 ECG Lead Noise Modifiers (Retired)**
This Context Group is retired. See PS3.16-2009.

**CID 3682 Probability (Retired)**
This Context Group is retired. See PS3.16-2009.

**CID 3683 Modifiers (Retired)**
This Context Group is retired. See PS3.16-2009.

**CID 3684 Trend (Retired)**
This Context Group is retired. See PS3.16-2009.

**CID 3685 Conjunctive Terms (Retired)**
This Context Group is retired. See PS3.16-2009.

**CID 3686 ECG Interpretive Statements (Retired)**
This Context Group is retired. See PS3.16-2009.

**CID 3687 Electrophysiology Waveform Durations**
This Context Group consists of the per-lead terms under the hierarchy of Reference ID MDC_ECG_TIME_PD in the ISO/IEEE 11073-10102 nomenclature.

The base terms from that hierarchy are included in the table below for reference. The per-lead base terms are pre-coordinated with concept discriminators for specific leads, and the code values for those pre-coordinated terms are arithmetically derived from the code values of the base terms. For the complete current list of terms and discriminator values, see the ISO/IEEE Standard. All pre-coordinated terms (measurements plus discriminators) within the identified hierarchy are part of this Context Group.

**Note**
1. A prior version of this context group used codes from the SCP-ECG coding system.

### CID 3688 Electrophysiology Waveform Voltages

This Context Group consists of the codes of the hierarchies under Reference IDs MDC_ECG_ELEC_POTL and MDC_ECG_AMPL of the ISO/IEEE 11073-10102 nomenclature.

The base terms from those hierarchies are included in the table below for reference. The per lead base terms are pre-coordinated with concept discriminators for specific leads, and the code values for those pre-coordinated terms are arithmetically derived from the code values of the base terms. For the complete current list of terms and discriminator values, see the ISO/IEEE Standard. All pre-coordinated terms (measurements plus discriminators) within the identified hierarchies are part of this Context Group.

**Note**
1. A prior version of this context group used codes from the SCP-ECG coding system.

CID 3689 ECG Global Waveform Durations

This Context Group consists of the global terms under the hierarchy of Reference ID MDC_ECG_TIME_PD in the ISO/IEEE 11073-10102 nomenclature.

The base terms from that hierarchy are included in the table below for reference. The base terms may be pre-coordinated with concept discriminators, and the code values for those pre-coordinated terms are arithmetically derived from the code values of the base terms. For the complete current list of terms and discriminator values, see the ISO/IEEE Standard. All pre-coordinated terms (measurements plus discriminators) within the identified hierarchy are part of this Context Group.

Note

A previous version of this context group used terms with the SNOMED concept "entire" (see PS3.16-2011). The use of "structure" concepts rather than "entire" is described in Section 8.1.1.

Note

1. In a prior version of this Context Group, Lateral Oblique was assigned the code R-10226, and Medial Oblique was assigned the code R-10220, as synonymous with Medio-Lateral Oblique and Latero-Medial Oblique, respectively. SNOMED currently distinguishes between LO and MLO, and between MO and LMO, although in most radiography contexts there is no practical distinction. Receiving applications should be aware that they may receive SOP Instances with the prior code assignments.

2. In a prior version of this Context Group, "right anterior oblique" was assigned the code R-10218, which in SNOMED is actually "Indirect iris transillumination"; this code has been replaced with the correct code R-40985.

3. In a prior version of this Context Group, a concept of "sagittal" was present with a code of R-10222, which in SNOMED is actually "Trypan blue"; this code has been replaced with the general SNOMED qualifier concept G-A145.

### CID 4012 Projection Eponymous Name

**Resources:**
- [HTML](#) | [FHIR JSON](#) | [FHIR XML](#) | [IHE SVS XML](#)

**Type:** Extensible  
**Version:** 20170914  
**UID:** 1.2.840.10008.6.1.296  

**Note**

In a prior version of this Context Group, the codes R-102C9, R-102CA, R-102CB, R-102CC, and R-102CE were specified for various concepts. Those codes are not actually in SNOMED, and their use in this context is deprecated. Although there is minimal possibility of misinterpretation with SOP Instances that may include the deprecated use, receiving applications should be aware of this change; see Annex J.

Note

1. In a prior version of this Context Group, Cranio-Caudal Exaggerated Laterally was assigned the code Y-X1770, and Cranio-Caudal Exaggerated Medially was assigned the code Y-X1771. Those codes are deprecated, as they are not valid SNOMED codes. Although there is minimal possibility of misinterpretation with SOP Instances that may include the deprecated codes, receiving applications should be aware of this change; see Annex J.
2. While SRT is the preferred Coding Scheme Designator for SNOMED, regulatory approval of mammography systems makes changes to such systems problematic. Implementers should be aware that many systems will continue to use the deprecated designator SNM3 for certain terms in this context group. It is recommended that implementations receiving Mammography Image or CAD SOP Instances support both SNM3 and SRT as equivalent Coding Scheme Designators for Attributes or Content Items that use this Context Group.

3. In a prior version of this Context Group, (R-102CF, SRT, "cranio-caudal exaggerated") was included. This is not a clinically applied view. Use of this term is deprecated, but receiving applications should be aware of its prior existence.

</table>

#### Note
1. The View ACR MQCM 1999 Equivalent is defined in CID 4014 “View for Mammography”.

2. Some applications and View Modifier ACR MQCM 1999 equivalents have been extended by DICOM to incorporate additional known clinical use cases. The View Modifier ACR MQCM 1999 equivalent indicates its use as a prefix (shown by trailing "...") or suffix (shown by preceding "...") to the View ACR MQCM 1999 equivalent, or replacement for the View ACR MQCM 1999 equivalent.

3. While SRT is the preferred Coding Scheme Designator for SNOMED, regulatory approval of mammography systems makes changes to such systems problematic. Implementers should be aware that many systems will continue to use the deprecated designator SNM3 for certain terms in this context group. It is recommended that implementations receiving Mammography Image or CAD SOP Instances support both SNM3 and SRT as equivalent Coding Scheme Designators for Attributes or Content Items that use this Context Group.
CID 4016 Anatomic Region for Intra-oral Radiography

Resources: HTML | FHIR JSON | FHIR XML | IHE SVS XML
Type: Non-Extensible
Version: 20150318
UID: 1.2.840.10008.6.1.300

Table CID 4016. Anatomic Region for Intra-oral Radiography

</tbody>
</table>

Note

In a prior version of this table, the code T-D1217 was specified for the concept "Maxilla and mandible". The use of this code conflicts with its assignment to another concept in SNOMED, and its use in this context is deprecated. Although there is minimal possibility of misinterpretation with SOP Instances that may include the deprecated use, receiving applications should be aware of this change; see Annex J.

CID 4017 Anatomic Region Modifier for Intra-oral Radiography

Resources: HTML | FHIR JSON | FHIR XML | IHE SVS XML
Type: Non-Extensible

<td>699503005</td>
</tr>
</tbody>
</table>

Note

In a prior version of this table, SNOMED codes T-51005 through T-5100C were specified for various concepts. The use of these codes conflicts with their assignment to other concepts in SNOMED, and the set of concepts has been replaced. Also, SNOMED code T-5100D was specified for an Occlusal view; this code does not exist in SNOMED, and the concept is more properly considered as a view rather than an anatomic region, hence has been moved to CID 4010, and assigned the correct SNOMED code R-40810. Although there is minimal possibility of misinterpretation with SOP Instances that may include the deprecated use, receiving applications should be aware of this change; the deprecated codes are included in Annex J.

#### Note

1. In a prior version of this table, the code T-D1217 was specified for the concept "Maxilla and mandible". The use of this code conflicts with its assignment to another concept in SNOMED, and its use in this context is deprecated. Although there is minimal possibility of misinterpretation with SOP Instances that may include the deprecated use, receiving applications should be aware of this change; see Annex J.

2. In a prior version of this table, the code T-D8300 was used for T-15430, T-12402 for T-D8500, T-15710 for T-D2500, T-73800 for T-73000, and T-11167 for T-11166. Although there is minimal possibility of misinterpretation with SOP Instances that may include the deprecated use, receiving applications should be aware of this change; see Annex J.

</table>

**Note**

For the purpose of this context group, where possible, the resonance peak in the spectrum corresponding to a particular metabolite is described using the concept from SNOMED for the substance corresponding to the metabolite. E.g., the code used for "lipid" is the code for "lipid (substance) ", as this concept is effectively post-coordinated by its use in the Metabolite Map Code Sequence (0018,9083) to mean "lipid resonance peaks in MR spectroscopy".

Note

(126326, DCM, "IAUC90BN") can be used for DCE-MRI using a Gd-based contrast agent to represent the IAUGCEBN measurement in the claim of the QIBA DCE MRI Quantification Profile, though the concept itself is not specific to the modality or the contrast agent used. See http://www.rsna.org/QIBA Protocols and Profiles.aspx. See also Ng, CS., et al. "Reproducibility of Perfusion Parameters in Dynamic Contrast-Enhanced MRI of Lung and Liver Tumors: Effect on Estimates of Patient Sample Size in Clinical Trials and on Individual Patient Responses." AJR 194, no. 2 (February 1, 2010): W134-40. http://dx.doi.org/10.2214/AJR.09.3116.

The type of contrast agent and the AIF used for blood normalization may or may not be post-coordinated.

E.g., voxel-wise IAUCBN measurements encoded as a parametric map with the quantity defined by the Quantity Definition Sequence (0040,9220) in a Real World Value Map might be encoded as:

\[(G-C1C6, SRT, "Quantity") = (126326, DCM, "IAUC90BN")\]

\[(G-C036, SRT, "Measurement Method") = (126362, DCM, "User-defined AIF ROI")\]

\[(123011, DCM, "Contrast Bolus/Agent") = (C-17800, SRT, "Gadolinium")\]

E.g., an IAUCBN measurement for an ROI encoded in a structured report might be encoded as:

\[\text{NUM (126326, DCM, "IAUC90BN") = 0.230 (UNITS = (normalized), UCUM, "normalized")}\]

\[>\text{HAS CONCEPT MOD: CODE (G-C036, SRT, "Measurement Method") = (126364, DCM, "Blind Estimation of AIF")}\]

Note that the generic ROI measurement templates do not have the contrast/bolus agent as a parameter; this may be implicit from context, or inherited from the (121058, DCM,"Procedure reported") in the parent template.

</tbody>
</table>

Note

(M-01000, SRT, "Morphologically Abnormal Structure") was previously described with a Code Meaning of "Lesion", but that synonym has been retired as "inappropriate" in SNOMED. The Code Meaning has been replaced with the preferred SNOMED term, and the separate concept (M-01100, SRT, "Lesion") added.
